## The l3sort package Sorting lists\*

The LaTeX3 Project

Released 2016/05/14

## 1 **I3sort** documentation

LATEX3 comes with a facility to sort list variables (sequences, token lists, or comma-lists) according to some user-defined comparison. For instance,

will result in  $\l_foo_clist$  holding the values { -2 , 01 , +1 , 3 , 5 } sorted in non-decreasing order.

The code defining the comparison should perform \sort\_reversed: if the two items given as #1 and #2 are not in the correct order, and otherwise it should call \sort\_-ordered: to indicate that the order of this pair of items should not be changed.

For instance, a  $\langle comparison\ code \rangle$  consisting only of \sort\_ordered: with no test will yield a trivial sort: the final order is identical to the original order. Conversely, using a  $\langle comparison\ code \rangle$  consisting only of \sort\_reversed: will reverse the list (in a fairly inefficient way).

**TEXhackers note:** Internally, the code from l3sort stores items in  $\toks$ . Thus, the  $\langle comparison\ code \rangle$  should not alter the contents of any  $\toks$ , nor assume that they hold a given value.

\seq\_sort:Nn \seq\_gsort:Nn  $\seq_sort:Nn \sequence\$  { $\comparison \code\$ }

Sorts the items in the  $\langle sequence \rangle$  according to the  $\langle comparison \ code \rangle$ , and assigns the result to  $\langle sequence \rangle$ .

<sup>\*</sup>This file describes v6492, last revised 2016/05/14.

\tl\_sort:Nn
\tl\_gsort:Nn

```
\tilde{c}  \tl_sort:Nn \tilde{c}  \tag{comparison code}
```

Sorts the items in the  $\langle tl \ var \rangle$  according to the  $\langle comparison \ code \rangle$ , and assigns the result to  $\langle tl \ var \rangle$ .

\clist\_sort:Nn
\clist\_gsort:Nn

```
\clist_sort:Nn \( clist var \) \{\( comparison code \) \}
```

Sorts the items in the  $\langle clist\ var \rangle$  according to the  $\langle comparison\ code \rangle$ , and assigns the result to  $\langle clist\ var \rangle$ .

\tl\_sort:nN ★

```
\t:nN {\langle token \ list \rangle} {\langle conditional \rangle}
```

Sorts the items in the  $\langle token\ list \rangle$ , using the  $\langle conditional \rangle$  to compare items, and leaves the result in the input stream. The  $\langle conditional \rangle$  should have signature :nnTF, and return true if the two items being compared should be left in the same order, and false if the items should be swapped.

**TEXhackers note:** The result is returned within \exp\_not:n, which means that the token list will not expand further when appearing in an x-type argument expansion.
