# The LATEX3 Interfaces

The LaTEX3 Project\*
May 18, 2016

#### Abstract

This is the reference documentation for the <code>expl3</code> programming environment. The <code>expl3</code> modules set up an experimental naming scheme for LATEX commands, which allow the LATEX programmer to systematically name functions and variables, and specify the argument types of functions.

The TeX and  $\varepsilon$ -TeX primitives are all given a new name according to these conventions. However, in the main direct use of the primitives is not required or encouraged: the expl3 modules define an independent low-level LaTeX3 programming language.

At present, the expl3 modules are designed to be loaded on top of LATEX  $2\varepsilon$ . In time, a LATEX3 format will be produced based on this code. This allows the code to be used in LATEX  $2\varepsilon$  packages now while a stand-alone LATEX3 is developed.

While expl3 is still experimental, the bundle is now regarded as broadly stable. The syntax conventions and functions provided are now ready for wider use. There may still be changes to some functions, but these will be minor when compared to the scope of expl3.

New modules will be added to the distributed version of  ${\sf expl3}$  as they reach maturity.

2	Box rotation and scaling	233
3	Color support	233
4	Drawing 4.1 Path construction	

## Part I

# Introduction to expl3 and this document

This document is intended to act as a comprehensive reference manual for the expl3 language. A general guide to the LATEX3 programming language is found in expl3.pdf.

# 1 Naming functions and variables

LATEX3 does not use @ as a "letter" for defining internal macros. Instead, the symbols \_ and : are used in internal macro names to provide structure. The name of each function is divided into logical units using \_, while : separates the name of the function from the argument specifier ("arg-spec"). This describes the arguments expected by the function. In most cases, each argument is represented by a single letter. The complete list of arg-spec letters for a function is referred to as the signature of the function.

Each function name starts with the *module* to which it belongs. Thus apart from a small number of very basic functions, all expl3 function names contain at least one underscore to divide the module name from the descriptive name of the function. For example, all functions concerned with comma lists are in module clist and begin \clist\_.

Every function must include an argument specifier. For functions which take no arguments, this will be blank and the function name will end: Most functions take one or more arguments, and use the following argument specifiers:

- D The D specifier means do not use. All of the TEX primitives are initially \let to a D name, and some are then given a second name. Only the kernel team should use anything with a D specifier!
- N and n These mean no manipulation, of a single token for N and of a set of tokens given in braces for n. Both pass the argument through exactly as given. Usually, if you use a single token for an n argument, all will be well.
- c This means *csname*, and indicates that the argument will be turned into a csname before being used. So \foo:c {ArgumentOne} will act in the same way as \foo:N \ArgumentOne.
- V and v These mean value of variable. The V and v specifiers are used to get the content of a variable without needing to worry about the underlying TEX structure containing the data. A V argument will be a single token (similar to N), for example \foo:V \MyVariable; on the other hand, using v a csname is constructed first, and then the value is recovered, for example \foo:v {MyVariable}.
- o This means *expansion once*. In general, the V and v specifiers are favoured over o for recovering stored information. However, o is useful for correctly processing information with delimited arguments.

- x The x specifier stands for *exhaustive expansion*: every token in the argument is fully expanded until only unexpandable ones remain. The T<sub>E</sub>X \edef primitive carries out this type of expansion. Functions which feature an x-type argument are in general *not* expandable, unless specifically noted.
- ${\tt f}$  The  ${\tt f}$  specifier stands for full expansion, and in contrast to  ${\tt x}$  stops at the first non-expandable item (reading the argument from left to right) without trying to expand it. For example, when setting a token list variable (a macro used for storage), the sequence

```
\tl_set:Nn \l_mya_tl { A }
\tl_set:Nn \l_myb_tl { B }
\tl_set:Nf \l_mya_tl { \l_mya_tl \l_myb_tl }
```

will leave \l\_mya\_tl with the content A\l\_myb\_tl, as A cannot be expanded and so terminates expansion before \l\_myb\_tl is considered.

- T and F For logic tests, there are the branch specifiers T (true) and F (false). Both specifiers treat the input in the same way as n (no change), but make the logic much easier to see.
- **p** The letter **p** indicates T<sub>E</sub>X parameters. Normally this will be used for delimited functions as expl3 provides better methods for creating simple sequential arguments.
- w Finally, there is the w specifier for weird arguments. This covers everything else, but mainly applies to delimited values (where the argument must be terminated by some arbitrary string).

Notice that the argument specifier describes how the argument is processed prior to being passed to the underlying function. For example, \foo:c will take its argument, convert it to a control sequence and pass it to \foo:N.

Variables are named in a similar manner to functions, but begin with a single letter to define the type of variable:

- c Constant: global parameters whose value should not be changed.
- g Parameters whose value should only be set globally.
- 1 Parameters whose value should only be set locally.

Each variable name is then build up in a similar way to that of a function, typically starting with the module<sup>1</sup> name and then a descriptive part. Variables end with a short identifier to show the variable type:

bool Either true or false.

box Box register.

<sup>&</sup>lt;sup>1</sup>The module names are not used in case of generic scratch registers defined in the data type modules, e.g., the int module contains some scratch variables called \l\_tmpa\_int, \l\_tmpb\_int, and so on. In such a case adding the module name up front to denote the module and in the back to indicate the type, as in \l\_int\_tmpa\_int would be very unreadable.

```
clist Comma separated list.
```

**coffin** a "box with handles" — a higher-level data type for carrying out **box** alignment operations.

```
dim "Rigid" lengths.
```

fp floating-point values;

int Integer-valued count register.

prop Property list.

seq "Sequence": a data-type used to implement lists (with access at both ends) and stacks.

skip "Rubber" lengths.

stream An input or output stream (for reading from or writing to, respectively).

tl Token list variables: placeholder for a token list.

#### 1.1 Terminological inexactitude

A word of warning. In this document, and others referring to the expl3 programming modules, we often refer to "variables" and "functions" as if they were actual constructs from a real programming language. In truth, TEX is a macro processor, and functions are simply macros that may or may not take arguments and expand to their replacement text. Many of the common variables are also macros, and if placed into the input stream will simply expand to their definition as well — a "function" with no arguments and a "token list variable" are in truth one and the same. On the other hand, some "variables" are actually registers that must be initialised and their values set and retrieved with specific functions.

The conventions of the expl3 code are designed to clearly separate the ideas of "macros that contain data" and "macros that contain code", and a consistent wrapper is applied to all forms of "data" whether they be macros or actually registers. This means that sometimes we will use phrases like "the function returns a value", when actually we just mean "the macro expands to something". Similarly, the term "execute" might be used in place of "expand" or it might refer to the more specific case of "processing in TeX's stomach" (if you are familiar with the TeXbook parlance).

If in doubt, please ask; chances are we've been hasty in writing certain definitions and need to be told to tighten up our terminology.

## 2 Documentation conventions

This document is typeset with the experimental l3doc class; several conventions are used to help describe the features of the code. A number of conventions are used here to make the documentation clearer.

Each group of related functions is given in a box. For a function with a "user" name, this might read:

#### \ExplSyntaxOn \ExplSyntaxOff

#### \ExplSyntaxOn ... \ExplSyntaxOff

The textual description of how the function works would appear here. The syntax of the function is shown in mono-spaced text to the right of the box. In this example, the function takes no arguments and so the name of the function is simply reprinted.

For programming functions, which use \_ and : in their name there are a few additional conventions: If two related functions are given with identical names but different argument specifiers, these are termed *variants* of each other, and the latter functions are printed in grey to show this more clearly. They will carry out the same function but will take different types of argument:

# \seq\_new:N

#### \seq\_new:N \langle sequence \rangle

\seq\_new:c Where a number of we

When a number of variants are described, the arguments are usually illustrated only for the base function. Here,  $\langle sequence \rangle$  indicates that  $\ensuremath{\tt seq\_new:N}$  expects the name of a sequence. From the argument specifier,  $\ensuremath{\tt seq\_new:c}$  also expects a sequence name, but as a name rather than as a control sequence. Each argument given in the illustration should be described in the following text.

Fully expandable functions Some functions are fully expandable, which allows it to be used within an x-type argument (in plain  $T_EX$  terms, inside an  $\ensuremath{\texttt{\equiv}}$  as well as within an f-type argument. These fully expandable functions are indicated in the documentation by a star:

#### \cs\_to\_str:N \*

 $\cs_{to\_str:N} \langle cs \rangle$ 

As with other functions, some text should follow which explains how the function works. Usually, only the star will indicate that the function is expandable. In this case, the function expects a  $\langle cs \rangle$ , shorthand for a  $\langle control\ sequence \rangle$ .

**Restricted expandable functions** A few functions are fully expandable but cannot be fully expanded within an f-type argument. In this case a hollow star is used to indicate this:

#### \seq\_map\_function:NN 🌣

 $\seq_map_function:NN \langle seq \rangle \langle function \rangle$ 

Conditional functions Conditional (if) functions are normally defined in three variants, with T, F and TF argument specifiers. This allows them to be used for different "true"/"false" branches, depending on which outcome the conditional is being used to test. To indicate this without repetition, this information is given in a shortened form:

\xetex\_if\_engine:TF

 $\xetex_if_engine:TF {\langle true \ code \rangle} {\langle false \ code \rangle}$ 

The underlining and italic of TF indicates that  $\xetex_if_engine:T$ ,  $\xetex_if_engine:F$  and  $\xetex_if_engine:TF$  are all available. Usually, the illustration will use the TF variant, and so both  $\xspace true \ code \xspace and \xspace true \ code \xspace will be shown. The two variant forms T and F take only <math>\xspace true \ code \xspace and \xspace true \ code \xspace and \xspace true \xspace \xspace \xspace \xspace true \xspace \x$ 

Variables, constants and so on are described in a similar manner:

\l\_tmpa\_tl

A short piece of text will describe the variable: there is no syntax illustration in this case. In some cases, the function is similar to one in LATEX  $2_{\varepsilon}$  or plain TeX. In these cases,

the text will include an extra "**T<sub>E</sub>Xhackers note**" section:

\token\_to\_str:N \*

\token\_to\_str:N \( token \)

The normal description text.

**TEX** hackers note: Detail for the experienced TEX or LATEX  $2\varepsilon$  programmer. In this case, it would point out that this function is the TEX primitive \string.

Changes to behaviour When new functions are added to expl3, the date of first inclusion is given in the documentation. Where the documented behaviour of a function changes after it is first introduced, the date of the update will also be given. This means that the programmer can be sure that any release of expl3 after the date given will contain the function of interest with expected behaviour as described. Note that changes to code internals, including bug fixes, are not recorded in this way *unless* they impact on the expected behaviour.

# 3 Formal language conventions which apply generally

As this is a formal reference guide for IATEX3 programming, the descriptions of functions are intended to be reasonably "complete". However, there is also a need to avoid repetition. Formal ideas which apply to general classes of function are therefore summarised here.

For tests which have a TF argument specification, the test if evaluated to give a logically TRUE or FALSE result. Depending on this result, either the  $\langle true\ code \rangle$  or the  $\langle false\ code \rangle$  will be left in the input stream. In the case where the test is expandable, and a predicate (\_p) variant is available, the logical value determined by the test is left in the input stream: this will typically be part of a larger logical construct.

# 4 TeX concepts not supported by LATEX3

The TeX concept of an "\outer" macro is not supported at all by LATeX3. As such, the functions provided here may break when used on top of LATeX  $2_{\mathcal{E}}$  if \outer tokens are used in the arguments.

#### Part II

# The **I3bootstrap** package Bootstrap code

# 1 Using the LATEX3 modules

The modules documented in source3 are designed to be used on top of IATEX  $2_{\varepsilon}$  and are loaded all as one with the usual \usepackage{expl3} or \RequirePackage{expl3} instructions. These modules will also form the basis of the IATEX3 format, but work in this area is incomplete and not included in this documentation at present.

As the modules use a coding syntax different from standard LATEX  $2_{\varepsilon}$  it provides a few functions for setting it up.

\ExplSyntaxOn \ExplSyntaxOff \ExplSyntaxOn  $\langle code \rangle$  \ExplSyntaxOff

Updated: 2011-08-13

The \ExplSyntaxOn function switches to a category code régime in which spaces are ignored and in which the colon (:) and underscore (\_) are treated as "letters", thus allowing access to the names of code functions and variables. Within this environment, ~ is used to input a space. The \ExplSyntaxOff reverts to the document category code régime.

\ProvidesExplPackage \ProvidesExplClass \ProvidesExplFile \RequirePackage{expl3}

 $\label{eq:condition} $$\operatorname{ProvidesExplPackage} {\langle package \rangle} {\langle date \rangle} {\langle version \rangle} {\langle description \rangle}$ 

These functions act broadly in the same way as the corresponding LaTeX  $2\varepsilon$  kernel functions \ProvidesPackage, \ProvidesClass and \ProvidesFile. However, they also implicitly switch \ExplSyntaxOn for the remainder of the code with the file. At the end of the file, \ExplSyntaxOff will be called to reverse this. (This is the same concept as LaTeX  $2\varepsilon$  provides in turning on \makeatletter within package and class code.) The  $\langle date \rangle$  should be given in the format  $\langle year \rangle / \langle month \rangle / \langle day \rangle$ .

\GetIdInfo

\_\_\_\_\_ \Ge Updated: 2012-06-04

\RequirePackage{13bootstrap}

 $\verb|\GetIdInfo $Id: \langle \mathit{SVN} \ info \ field \rangle \ \$ \ \{\langle \mathit{description} \rangle\}|$ 

Extracts all information from a SVN field. Spaces are not ignored in these fields. The information pieces are stored in separate control sequences with \ExplFileName for the part of the file name leading up to the period, \ExplFileDate for date, \ExplFileVersion for version and \ExplFileDescription for the description.

To summarize: Every single package using this syntax should identify itself using one of the above methods. Special care is taken so that every package or class file loaded with \RequirePackage or alike are loaded with usual  $\LaTeX$  category codes and the  $\LaTeX$  category code scheme is reloaded when needed afterwards. See implementation for details. If you use the \GetIdInfo command you can use the information when loading a package with

\ProvidesExplPackage{\ExplFileName}
{\ExplFileDate}{\ExplFileVersion}{\ExplFileDescription}

# 1.1 Internal functions and variables

\l\_\_kernel\_expl\_bool

A boolean which records the current code syntax status: true if currently inside a code environment. This variable should only be set by \ExplSyntaxOn/\ExplSyntaxOff.

# Part III The I3names package Namespace for primitives

# 1 Setting up the LATEX3 programming language

This module is at the core of the LATEX3 programming language. It performs the following tasks:

- defines new names for all T<sub>E</sub>X primitives;
- switches to the category code régime for programming;
- provides support settings for building the code as a TEX format.

This module is entirely dedicated to primitives, which should not be used directly within IATEX3 code (outside of "kernel-level" code). As such, the primitives are not documented here: *The TeXbook*, *TeX by Topic* and the manuals for pdfTeX, XaTeX and LuaTeX should be consulted for details of the primitives. These are named based on the engine which first introduced them:

```
\tex_... Introduced by T<sub>E</sub>X itself;
\etex_... Introduced by the ε-T<sub>E</sub>X extensions;
\pdftex_... Introduced by pdfT<sub>E</sub>X;
\xetex_... Introduced by X<sub>E</sub>T<sub>E</sub>X;
\luatex_... Introduced by LuaT<sub>E</sub>X.
```

## Part IV

# The **I3basics** package Basic definitions

As the name suggest this package holds some basic definitions which are needed by most or all other packages in this set.

Here we describe those functions that are used all over the place. With that we mean functions dealing with the construction and testing of control sequences. Furthermore the basic parts of conditional processing are covered; conditional processing dealing with specific data types is described in the modules specific for the respective data types.

# 1 No operation functions

\prg\_do\_nothing:

\prg\_do\_nothing:

An expandable function which does nothing at all: leaves nothing in the input stream after a single expansion.

\scan\_stop:

\scan\_stop:

A non-expandable function which does nothing. Does not vanish on expansion but produces no typeset output.

# 2 Grouping material

\group\_begin: \group\_end:

\group\_begin:

\group\_end:

These functions begin and end a group for definition purposes. Assignments are local to groups unless carried out in a global manner. (A small number of exceptions to this rule will be noted as necessary elsewhere in this document.) Each \group\_begin: must be matched by a \group\_end:, although this does not have to occur within the same function. Indeed, it is often necessary to start a group within one function and finish it within another, for example when seeking to use non-standard category codes.

\group\_insert\_after:N

\group\_insert\_after:N \langle token \rangle

Adds  $\langle token \rangle$  to the list of  $\langle tokens \rangle$  to be inserted when the current group level ends. The list of  $\langle tokens \rangle$  to be inserted will be empty at the beginning of a group: multiple applications of \group\_insert\_after:N may be used to build the inserted list one  $\langle token \rangle$  at a time. The current group level may be closed by a \group\_end: function or by a token with category code 2 (close-group). The later will be a } if standard category codes apply.

# 3 Control sequences and functions

As  $T_EX$  is a macro language, creating new functions means creating macros. At point of use, a function is replaced by the replacement text ("code") in which each parameter in the code (#1, #2, etc.) is replaced the appropriate arguments absorbed by the function. In the following,  $\langle code \rangle$  is therefore used as a shorthand for "replacement text".

Functions which are not "protected" will be fully expanded inside an x expansion. In contrast, "protected" functions are not expanded within x expansions.

# 3.1 Defining functions

Functions can be created with no requirement that they are declared first (in contrast to variables, which must always be declared). Declaring a function before setting up the code means that the name chosen will be checked and an error raised if it is already in use. The name of a function can be checked at the point of definition using the \cs\_new... functions: this is recommended for all functions which are defined for the first time.

There are three ways to define new functions. All classes define a function to expand to the substitution text. Within the substitution text the actual parameters are substituted for the formal parameters (#1, #2,...).

- **new** Create a new function with the **new** scope, such as \cs\_new:Npn. The definition is global and will result in an error if it is already defined.
- set Create a new function with the set scope, such as \cs\_set:Npn. The definition is restricted to the current TEX group and will not result in an error if the function is already defined.
- gset Create a new function with the gset scope, such as \cs\_gset:Npn. The definition is global and will not result in an error if the function is already defined.

Within each set of scope there are different ways to define a function. The differences depend on restrictions on the actual parameters and the expandability of the resulting function.

- nopar Create a new function with the nopar restriction, such as \cs\_set\_nopar:Npn.

  The parameter may not contain \par tokens.
- protected Create a new function with the protected restriction, such as \cs\_set\_protected:Npn. The parameter may contain \par tokens but the function will not expand within an x-type expansion.

Finally, the functions in Subsections 3.2 and 3.3 are primarily meant to define base functions only. Base functions can only have the following argument specifiers:

N and n No manipulation.

- T and F Functionally equivalent to n (you are actually encouraged to use the family of \prg\_new\_conditional: functions described in Section 1).
- $\boldsymbol{p}$  and  $\boldsymbol{w}$  These are special cases.

The \cs\_new: functions below (and friends) do not stop you from using other argument specifiers in your function names, but they do not handle expansion for you. You should define the base function and then use \cs\_generate\_variant:Nn to generate custom variants as described in Section 2.

# 3.2 Defining new functions using parameter text

\cs\_new:Npn

 $\verb|\cs_new:Npn| \langle function \rangle \langle parameters \rangle \{\langle code \rangle\}|$ 

\cs\_new:cpn
\cs\_new:Npx

\cs\_new:cpx

Creates  $\langle function \rangle$  to expand to  $\langle code \rangle$  as replacement text. Within the  $\langle code \rangle$ , the  $\langle parameters \rangle$  (#1, #2, etc.) will be replaced by those absorbed by the function. The definition is global and an error will result if the  $\langle function \rangle$  is already defined.

\cs\_new\_nopar:Npn
\cs\_new\_nopar:cpn
\cs\_new\_nopar:Npx
\cs\_new\_nopar:cpx

\cs\_new\_nopar:Npn \( function \) \( \text{parameters} \) \{ \( (code \) \)}

Creates  $\langle function \rangle$  to expand to  $\langle code \rangle$  as replacement text. Within the  $\langle code \rangle$ , the  $\langle parameters \rangle$  (#1, #2, etc.) will be replaced by those absorbed by the function. When the  $\langle function \rangle$  is used the  $\langle parameters \rangle$  absorbed cannot contain  $\rangle$  are tokens. The definition is global and an error will result if the  $\langle function \rangle$  is already defined.

\cs\_new\_protected:Npn
\cs\_new\_protected:cpn
\cs\_new\_protected:Npx
\cs\_new\_protected:cpx

 $\cs_new_protected:Npn \langle function \rangle \langle parameters \rangle \{\langle code \rangle\}$ 

Creates  $\langle function \rangle$  to expand to  $\langle code \rangle$  as replacement text. Within the  $\langle code \rangle$ , the  $\langle parameters \rangle$  (#1, #2, etc.) will be replaced by those absorbed by the function. The  $\langle function \rangle$  will not expand within an x-type argument. The definition is global and an error will result if the  $\langle function \rangle$  is already defined.

 $\cs_new_protected_nopar:Npn \langle function \rangle \langle parameters \rangle \{\langle code \rangle\}$ 

\cs\_new\_protected\_nopar:Npn
\cs\_new\_protected\_nopar:cpn
\cs\_new\_protected\_nopar:Npx
\cs\_new\_protected\_nopar:cpx

Creates  $\langle function \rangle$  to expand to  $\langle code \rangle$  as replacement text. Within the  $\langle code \rangle$ , the  $\langle parameters \rangle$  (#1, #2, etc.) will be replaced by those absorbed by the function. When the  $\langle function \rangle$  is used the  $\langle parameters \rangle$  absorbed cannot contain  $\langle par$  tokens. The  $\langle function \rangle$  will not expand within an x-type argument. The definition is global and an error will result if the  $\langle function \rangle$  is already defined.

\cs\_set:Npn

 $\verb|\cs_set:Npn| \langle function \rangle \langle parameters \rangle \{\langle code \rangle\}|$ 

\cs\_set:cpn
\cs\_set:Npx

\cs\_set:Npx \cs\_set:cpx

Sets  $\langle function \rangle$  to expand to  $\langle code \rangle$  as replacement text. Within the  $\langle code \rangle$ , the  $\langle parameters \rangle$  (#1, #2, etc.) will be replaced by those absorbed by the function. The assignment of a meaning to the  $\langle function \rangle$  is restricted to the current TeX group level.

\cs\_set\_nopar:Npn
\cs\_set\_nopar:cpn

 $\verb|\cs_set_nopar:Npn| \langle function \rangle | \langle parameters \rangle | \{\langle code \rangle\}|$ 

\cs\_set\_nopar:Npx
\cs\_set\_nopar:cpx

Sets  $\langle function \rangle$  to expand to  $\langle code \rangle$  as replacement text. Within the  $\langle code \rangle$ , the  $\langle parameters \rangle$  (#1, #2, etc.) will be replaced by those absorbed by the function. When the  $\langle function \rangle$  is used the  $\langle parameters \rangle$  absorbed cannot contain \par tokens. The assignment of a meaning to the  $\langle function \rangle$  is restricted to the current T<sub>F</sub>X group level.

\cs\_set\_protected:Npn
\cs\_set\_protected:cpn
\cs\_set\_protected:Npx
\cs\_set\_protected:cpx

 $\verb|\cs_set_protected:Npn| \langle function \rangle | \langle parameters \rangle | \{\langle code \rangle\}|$ 

Sets  $\langle function \rangle$  to expand to  $\langle code \rangle$  as replacement text. Within the  $\langle code \rangle$ , the  $\langle parameters \rangle$  (#1, #2, etc.) will be replaced by those absorbed by the function. The assignment of a meaning to the  $\langle function \rangle$  is restricted to the current TEX group level. The  $\langle function \rangle$  will not expand within an x-type argument.

\cs\_set\_protected\_nopar:Npn
\cs\_set\_protected\_nopar:Cpn
\cs\_set\_protected\_nopar:Npx
\cs\_set\_protected\_nopar:cpx

 $\verb|\cs_set_protected_nopar:Npn| \langle function \rangle | \langle parameters \rangle | \{\langle code \rangle\}|$ 

Sets  $\langle function \rangle$  to expand to  $\langle code \rangle$  as replacement text. Within the  $\langle code \rangle$ , the  $\langle parameters \rangle$  (#1, #2, etc.) will be replaced by those absorbed by the function. When the  $\langle function \rangle$  is used the  $\langle parameters \rangle$  absorbed cannot contain \par tokens. The assignment of a meaning to the  $\langle function \rangle$  is restricted to the current TeX group level. The  $\langle function \rangle$  will not expand within an x-type argument.

\cs\_gset:Npn

\cs\_gset:Npn \langle function \rangle \cparameters \langle \langle \code \rangle \rangle

\cs\_gset:cpn
\cs\_gset:Npx
\cs\_gset:cpx

Globally sets  $\langle function \rangle$  to expand to  $\langle code \rangle$  as replacement text. Within the  $\langle code \rangle$ , the  $\langle parameters \rangle$  (#1, #2, etc.) will be replaced by those absorbed by the function. The assignment of a meaning to the  $\langle function \rangle$  is not restricted to the current TEX group level: the assignment is global.

\cs\_gset\_nopar:Npn
\cs\_gset\_nopar:cpn
\cs\_gset\_nopar:Npx

\cs\_gset\_nopar:cpx

 $\cs_gset_nopar:Npn \langle function \rangle \langle parameters \rangle \{\langle code \rangle\}$ 

Globally sets  $\langle function \rangle$  to expand to  $\langle code \rangle$  as replacement text. Within the  $\langle code \rangle$ , the  $\langle parameters \rangle$  (#1, #2, etc.) will be replaced by those absorbed by the function. When the  $\langle function \rangle$  is used the  $\langle parameters \rangle$  absorbed cannot contain \par tokens. The assignment of a meaning to the  $\langle function \rangle$  is not restricted to the current TEX group level: the assignment is global.

\cs\_gset\_protected:Npn
\cs\_gset\_protected:cpn
\cs\_gset\_protected:Npx
\cs\_gset\_protected:cpx

 $\cs_gset_protected:Npn \langle function \rangle \langle parameters \rangle \{\langle code \rangle\}$ 

Globally sets  $\langle function \rangle$  to expand to  $\langle code \rangle$  as replacement text. Within the  $\langle code \rangle$ , the  $\langle parameters \rangle$  (#1, #2, etc.) will be replaced by those absorbed by the function. The assignment of a meaning to the  $\langle function \rangle$  is not restricted to the current TeX group level: the assignment is global. The  $\langle function \rangle$  will not expand within an x-type argument.

```
\cs_gset_protected_nopar:Npn
\cs_gset_protected_nopar:cpn
\cs_gset_protected_nopar:Npx
\cs_gset_protected_nopar:cpx
```

 $\verb|\cs_gset_protected_nopar:Npn| \langle function \rangle \langle parameters \rangle | \{\langle code \rangle\}|$ 

Globally sets  $\langle function \rangle$  to expand to  $\langle code \rangle$  as replacement text. Within the  $\langle code \rangle$ , the  $\langle parameters \rangle$  (#1, #2, etc.) will be replaced by those absorbed by the function. When the  $\langle function \rangle$  is used the  $\langle function \rangle$  absorbed cannot contain \par tokens. The assignment of a meaning to the  $\langle function \rangle$  is not restricted to the current TeX group level: the assignment is global. The  $\langle function \rangle$  will not expand within an x-type argument.

# 3.3 Defining new functions using the signature

 $\cs_new: Nn \\ \cs_new: (cn|Nx|cx)$ 

 $\c \sum_{new: Nn \ (function) \ \{(code)\}\}$ 

Creates  $\langle function \rangle$  to expand to  $\langle code \rangle$  as replacement text. Within the  $\langle code \rangle$ , the number of  $\langle parameters \rangle$  is detected automatically from the function signature. These  $\langle parameters \rangle$  (#1, #2, etc.) will be replaced by those absorbed by the function. The definition is global and an error will result if the  $\langle function \rangle$  is already defined.

\cs\_new\_nopar:Nn \cs\_new\_nopar:(cn|Nx|cx)  $\cs_new_nopar:Nn \langle function \rangle \{\langle code \rangle\}$ 

Creates  $\langle function \rangle$  to expand to  $\langle code \rangle$  as replacement text. Within the  $\langle code \rangle$ , the number of  $\langle parameters \rangle$  is detected automatically from the function signature. These  $\langle parameters \rangle$  (#1, #2, etc.) will be replaced by those absorbed by the function. When the  $\langle function \rangle$  is used the  $\langle parameters \rangle$  absorbed cannot contain  $\langle parameters \rangle$ . The definition is global and an error will result if the  $\langle function \rangle$  is already defined.

\cs\_new\_protected:Nn \cs\_new\_protected:(cn|Nx|cx)  $\cs_new_protected:Nn \langle function \rangle \{\langle code \rangle\}$ 

result if the  $\langle function \rangle$  is already defined.

Creates  $\langle function \rangle$  to expand to  $\langle code \rangle$  as replacement text. Within the  $\langle code \rangle$ , the number of  $\langle parameters \rangle$  is detected automatically from the function signature. These  $\langle parameters \rangle$  (#1, #2, etc.) will be replaced by those absorbed by the function. The  $\langle function \rangle$  will not expand within an x-type argument. The definition is global and an error will result if the  $\langle function \rangle$  is already defined.

\cs\_new\_protected\_nopar:Nn
\cs\_new\_protected\_nopar:(cn|Nx|cx)

 $\cs_new_protected_nopar:Nn \langle function \rangle \{\langle code \rangle\}$ 

Creates  $\langle function \rangle$  to expand to  $\langle code \rangle$  as replacement text. Within the  $\langle code \rangle$ , the number of  $\langle parameters \rangle$  is detected automatically from the function signature. These  $\langle parameters \rangle$  (#1, #2, etc.) will be replaced by those absorbed by the function. When the  $\langle function \rangle$  is used the  $\langle parameters \rangle$  absorbed cannot contain  $\langle parameters \rangle$  will not expand within an x-type argument. The definition is global and an error will

\cs\_set:Nn \cs\_set:(cn|Nx|cx)  $\cs_set:Nn \langle function \rangle \{\langle code \rangle\}$ 

Sets  $\langle function \rangle$  to expand to  $\langle code \rangle$  as replacement text. Within the  $\langle code \rangle$ , the number of  $\langle parameters \rangle$  is detected automatically from the function signature. These  $\langle parameters \rangle$  (#1, #2, etc.) will be replaced by those absorbed by the function. The assignment of a meaning to the  $\langle function \rangle$  is restricted to the current TeX group level.

\cs\_set\_nopar:Nn
\cs\_set\_nopar:(cn|Nx|cx)

 $\cs_set_nopar: Nn \langle function \rangle \{\langle code \rangle\}$ 

Sets  $\langle function \rangle$  to expand to  $\langle code \rangle$  as replacement text. Within the  $\langle code \rangle$ , the number of  $\langle parameters \rangle$  is detected automatically from the function signature. These  $\langle parameters \rangle$  (#1, #2, etc.) will be replaced by those absorbed by the function. When the  $\langle function \rangle$  is used the  $\langle parameters \rangle$  absorbed cannot contain  $\langle parameters \rangle$  absorbed cannot contain  $\langle parameters \rangle$  are assignment of a meaning to the  $\langle function \rangle$  is restricted to the current TeX group level.

\cs\_set\_protected:Nn \cs\_set\_protected:(cn|Nx|cx)  $\cs_set_protected:Nn \langle function \rangle \{\langle code \rangle\}$ 

Sets  $\langle function \rangle$  to expand to  $\langle code \rangle$  as replacement text. Within the  $\langle code \rangle$ , the number of  $\langle parameters \rangle$  is detected automatically from the function signature. These  $\langle parameters \rangle$  (#1, #2, etc.) will be replaced by those absorbed by the function. The  $\langle function \rangle$  will not expand within an x-type argument. The assignment of a meaning to the  $\langle function \rangle$  is restricted to the current TeX group level.

\cs\_set\_protected\_nopar:Nn
\cs\_set\_protected\_nopar:(cn|Nx|cx)

 $\verb|\cs_set_protected_nopar:Nn| \langle function \rangle | \{\langle code \rangle\}|$ 

Sets  $\langle function \rangle$  to expand to  $\langle code \rangle$  as replacement text. Within the  $\langle code \rangle$ , the number of  $\langle parameters \rangle$  is detected automatically from the function signature. These  $\langle parameters \rangle$  (#1, #2, etc.) will be replaced by those absorbed by the function. When the  $\langle function \rangle$  is used the  $\langle parameters \rangle$  absorbed cannot contain  $\langle parameters \rangle$  absorbed cannot contain  $\langle parameters \rangle$  are argument. The assignment of a meaning to the  $\langle function \rangle$  is restricted to the current  $\langle function \rangle$  is restricted to the current  $\langle function \rangle$  is

\cs\_gset:Nn
\cs\_gset:(cn|Nx|cx)

 $\cs_gset:Nn \langle function \rangle \{\langle code \rangle\}$ 

Sets  $\langle function \rangle$  to expand to  $\langle code \rangle$  as replacement text. Within the  $\langle code \rangle$ , the number of  $\langle parameters \rangle$  is detected automatically from the function signature. These  $\langle parameters \rangle$  (#1, #2, etc.) will be replaced by those absorbed by the function. The assignment of a meaning to the  $\langle function \rangle$  is global.

\cs\_gset\_nopar:Nn
\cs\_gset\_nopar:(cn|Nx|cx)

 $\cs_gset_nopar:Nn \langle function \rangle \{\langle code \rangle\}$ 

Sets  $\langle function \rangle$  to expand to  $\langle code \rangle$  as replacement text. Within the  $\langle code \rangle$ , the number of  $\langle parameters \rangle$  is detected automatically from the function signature. These  $\langle parameters \rangle$  (#1, #2, etc.) will be replaced by those absorbed by the function. When the  $\langle function \rangle$  is used the  $\langle parameters \rangle$  absorbed cannot contain  $\langle parameters \rangle$  absorbed cannot contain  $\langle parameters \rangle$  are assignment of a meaning to the  $\langle function \rangle$  is global.

```
\cs_gset_protected:Nn
\cs_gset_protected:(cn|Nx|cx)
```

 $\verb|\cs_gset_protected:Nn| \langle function \rangle | \{\langle code \rangle\}|$ 

Sets  $\langle function \rangle$  to expand to  $\langle code \rangle$  as replacement text. Within the  $\langle code \rangle$ , the number of  $\langle parameters \rangle$  is detected automatically from the function signature. These  $\langle parameters \rangle$  (#1, #2, etc.) will be replaced by those absorbed by the function. The  $\langle function \rangle$  will not expand within an x-type argument. The assignment of a meaning to the  $\langle function \rangle$  is global.

\cs\_gset\_protected\_nopar:Nn

 $\verb|\cs_gset_protected_nopar:Nn| \langle function \rangle | \{\langle code \rangle\}|$ 

\cs\_gset\_protected\_nopar:(cn|Nx|cx)

Sets  $\langle function \rangle$  to expand to  $\langle code \rangle$  as replacement text. Within the  $\langle code \rangle$ , the number of  $\langle parameters \rangle$  is detected automatically from the function signature. These  $\langle parameters \rangle$  (#1, #2, etc.) will be replaced by those absorbed by the function. When the  $\langle function \rangle$  is used the  $\langle parameters \rangle$  absorbed cannot contain  $\langle parameters \rangle$  absorbed cannot contain  $\langle parameters \rangle$  will not expand within an x-type argument. The assignment of a meaning to the  $\langle function \rangle$  is global.

\cs\_generate\_from\_arg\_count:NNnn \cs\_generate\_from\_arg\_count:(cNnn|Ncnn)  $\label{local_condition} $$ \cs_generate_from_arg_count:NNnn $$ \langle function \rangle $$ \langle creator \rangle $$ \langle number \rangle $$ \langle code \rangle $$$ 

Updated: 2012-01-14

Uses the  $\langle creator \rangle$  function (which should have signature Npn, for example \cs\_new:Npn) to define a  $\langle function \rangle$  which takes  $\langle number \rangle$  arguments and has  $\langle code \rangle$  as replacement text. The  $\langle number \rangle$  of arguments is an integer expression, evaluated as detailed for \int\_eval:n.

# 3.4 Copying control sequences

Control sequences (not just functions as defined above) can be set to have the same meaning using the functions described here. Making two control sequences equivalent means that the second control sequence is a *copy* of the first (rather than a pointer to it). Thus the old and new control sequence are not tied together: changes to one are not reflected in the other.

In the following text "cs" is used as an abbreviation for "control sequence".

\cs\_new\_eq:NN
\cs\_new\_eq:(Nc|cN|cc)

```
\cs_new_eq:NN \langle cs_1 \rangle \langle cs_2 \rangle \cs_new_eq:NN \langle cs_1 \rangle \langle token \rangle
```

Globally creates  $\langle control\ sequence_1\rangle$  and sets it to have the same meaning as  $\langle control\ sequence_2\rangle$  or  $\langle token\rangle$ . The second control sequence may subsequently be altered without affecting the copy.

```
\cs_set_eq:NN \\ \cs_set_eq:(Nc|cN|cc)
```

```
\cs_set_eq:NN \ \langle cs_1 \rangle \ \langle cs_2 \rangle \ \cs_set_eq:NN \ \langle cs_1 \rangle \ \langle token \rangle
```

Sets  $\langle control\ sequence_1 \rangle$  to have the same meaning as  $\langle control\ sequence_2 \rangle$  (or  $\langle token \rangle$ ). The second control sequence may subsequently be altered without affecting the copy. The assignment of a meaning to the  $\langle control\ sequence_1 \rangle$  is restricted to the current TeX group level.

 $\label{local_condition} $$ \cs_gset_eq:NN $$ \cs_gset_eq:(Nc|cN|cc) $$$ 

```
\cs_gset_eq: NN \ \langle cs_1 \rangle \ \langle cs_2 \rangle \\ \cs_gset_eq: NN \ \langle cs_1 \rangle \ \langle token \rangle
```

Globally sets  $\langle control\ sequence_1 \rangle$  to have the same meaning as  $\langle control\ sequence_2 \rangle$  (or  $\langle token \rangle$ ). The second control sequence may subsequently be altered without affecting the copy. The assignment of a meaning to the  $\langle control\ sequence_1 \rangle$  is not restricted to the current T<sub>F</sub>X group level: the assignment is global.

# 3.5 Deleting control sequences

There are occasions where control sequences need to be deleted. This is handled in a very simple manner.

\cs\_undefine:N
\cs\_undefine:c

\cs\_undefine:N \( control \) sequence \( \)

Sets  $\langle control \ sequence \rangle$  to be globally undefined.

Updated: 2011-09-15

#### 3.6 Showing control sequences

\cs\_meaning:N \*
\cs\_meaning:c \*

\cs\_meaning:N \( control \) sequence \( \)

Updated: 2011-12-22

This function expands to the *meaning* of the  $\langle control\ sequence \rangle$  control sequence. This will show the  $\langle replacement\ text \rangle$  for a macro.

 $T_EX$  hackers note: This is  $T_EX$ 's \meaning primitive. The c variant correctly reports undefined arguments.

\cs\_show:N

\cs\_show:N \( control \) sequence \( \)

Updated: 2015-08-03

Displays the definition of the  $\langle control\ sequence \rangle$  on the terminal.

**TeXhackers note:** This is similar to the TeX primitive  $\show$ , wrapped to a fixed number of characters per line.

## 3.7 Converting to and from control sequences

\use:c ★

```
\use:c {\( control \) sequence name\\)}
```

Converts the given  $\langle control\ sequence\ name \rangle$  into a single control sequence token. This process requires two expansions. The content for  $\langle control\ sequence\ name \rangle$  may be literal material or from other expandable functions. The  $\langle control\ sequence\ name \rangle$  must, when fully expanded, consist of character tokens which are not active: typically, they will be of category code 10 (space), 11 (letter) or 12 (other), or a mixture of these.

As an example of the \use:c function, both

```
\use:c { a b c }
and

\tl_new:N \l_my_tl
\tl_set:Nn \l_my_tl { a b c }
\use:c { \tl_use:N \l_my_tl }

would be equivalent to
\abc

after two expansions of \use:c.
```

\cs\_if\_exist\_use:N \*
\cs\_if\_exist\_use:c \*

```
\cs_if_exist_use:N \( control \) sequence \( \)
```

New: 2012-11-10

Tests whether the  $\langle control\ sequence \rangle$  is currently defined (whether as a function or another control sequence type), and if it does inserts the  $\langle control\ sequence \rangle$  into the input stream.

\cs\_if\_exist\_use:N<u>TF</u> \* \cs\_if\_exist\_use:c<u>TF</u> \*

```
\verb|\cs_if_exist_use:NTF| & \langle control \ sequence \rangle \ \{ \langle true \ code \rangle \} \ \{ \langle false \ code \rangle \} \\
```

New: 2012-11-10

Tests whether the  $\langle control\ sequence \rangle$  is currently defined (whether as a function or another control sequence type), and if it does inserts the  $\langle control\ sequence \rangle$  into the input stream followed by the  $\langle true\ code \rangle$ .

\cs:w \*
\cs\_end: \*

```
\verb|\cs:w| (control sequence name) | \cs_end:
```

Converts the given  $\langle control\ sequence\ name \rangle$  into a single control sequence token. This process requires one expansion. The content for  $\langle control\ sequence\ name \rangle$  may be literal material or from other expandable functions. The  $\langle control\ sequence\ name \rangle$  must, when fully expanded, consist of character tokens which are not active: typically, they will be of category code 10 (space), 11 (letter) or 12 (other), or a mixture of these.

TEXhackers note: These are the TEX primitives \csname and \endcsname.

As an example of the \cs:w and \cs\_end: functions, both

```
\cs:w a b c \cs end:
```

and

```
\tl_new:N \l_my_tl
\tl_set:Nn \l_my_tl { a b c }
\cs:w \tl_use:N \l_my_tl \cs_end:
would be equivalent to
\abc
```

after one expansion of \cs:w.

\cs\_to\_str:N \*

```
\cs_to_str:N \( control \) sequence \( \)
```

Converts the given  $\langle control\ sequence \rangle$  into a series of characters with category code 12 (other), except spaces, of category code 10. The sequence will not include the current escape token, cf.  $\token_to_str:N$ . Full expansion of this function requires exactly 2 expansion steps, and so an x-type expansion, or two o-type expansions will be required to convert the  $\langle control\ sequence \rangle$  to a sequence of characters in the input stream. In most cases, an f-expansion will be correct as well, but this loses a space at the start of the result.

# 4 Using or removing tokens and arguments

Tokens in the input can be read and used or read and discarded. If one or more tokens are wrapped in braces then in absorbing them the outer set will be removed. At the same time, the category code of each token is set when the token is read by a function (if it is read more than once, the category code is determined by the situation in force when first function absorbs the token).

As illustrated, these functions will absorb between one and four arguments, as indicated by the argument specifier. The braces surrounding each argument will be removed leaving the remaining tokens in the input stream. The category code of these tokens will also be fixed by this process (if it has not already been by some other absorption). All of these functions require only a single expansion to operate, so that one expansion of

```
\use:nn { abc } { { def } }
will result in the input stream containing
   abc { def }
i.e. only the outer braces will be removed.
```

\use\_i:nn \*
\use\_ii:nn \*

```
\use_i:nn \{\langle arg_1 \rangle\} \{\langle arg_2 \rangle\}
```

These functions absorb two arguments from the input stream. The function \use\_i:nn discards the second argument, and leaves the content of the first argument in the input stream. \use\_ii:nn discards the first argument and leaves the content of the second argument in the input stream. The category code of these tokens will also be fixed (if it has not already been by some other absorption). A single expansion is needed for the functions to take effect.

```
\use_i:nnn \{\langle arg_1 \rangle\} \{\langle arg_2 \rangle\} \{\langle arg_3 \rangle\}
```

These functions absorb three arguments from the input stream. The function \use\_i:nnn discards the second and third arguments, and leaves the content of the first argument in the input stream. \use\_ii:nnn and \use\_iii:nnn work similarly, leaving the content of second or third arguments in the input stream, respectively. The category code of these tokens will also be fixed (if it has not already been by some other absorption). A single expansion is needed for the functions to take effect.

```
\use_i:nnnn {\langle arg_1 \rangle} {\langle arg_2 \rangle} {\langle arg_3 \rangle} {\langle arg_4 \rangle}
```

These functions absorb four arguments from the input stream. The function \use\_-i:nnnn discards the second, third and fourth arguments, and leaves the content of the first argument in the input stream. \use\_ii:nnnn, \use\_iii:nnnn and \use\_iv:nnnn work similarly, leaving the content of second, third or fourth arguments in the input stream, respectively. The category code of these tokens will also be fixed (if it has not already been by some other absorption). A single expansion is needed for the functions to take effect.

\use\_i\_ii:nnn

```
\use_i_ii:nnn \{\langle arg_1 \rangle\} \{\langle arg_2 \rangle\} \{\langle arg_3 \rangle\}
```

This functions will absorb three arguments and leave the content of the first and second in the input stream. The category code of these tokens will also be fixed (if it has not already been by some other absorption). A single expansion is needed for the functions to take effect. An example:

```
\use_i_ii:nnn { abc } { { def } } { ghi }
```

will result in the input stream containing

```
abc { def }
```

i.e. the outer braces will be removed and the third group will be removed.

```
\use_none:n \{\langle group_1 \rangle\}
```

These functions absorb between one and nine groups from the input stream, leaving nothing on the resulting input stream. These functions work after a single expansion. One or more of the  $\bf n$  arguments may be an unbraced single token (*i.e.* an  $\bf N$  argument).

\use:x Undated: 2011-12-31

```
\use:x {\(\left(\text{expandable tokens}\right)\)}
```

Fully expands the *(expandable tokens)* and inserts the result into the input stream at the current location. Any hash characters (#) in the argument must be doubled.

# 4.1 Selecting tokens from delimited arguments

A different kind of function for selecting tokens from the token stream are those that use delimited arguments.

Absorb the  $\langle balanced\ text \rangle$  form the input stream delimited by the marker given in the function name, leaving nothing in the input stream.

Absorb the  $\langle balanced\ text \rangle$  form the input stream delimited by the marker given in the function name, leaving  $\langle inserted\ tokens \rangle$  in the input stream for further processing.

# 5 Predicates and conditionals

LATEX3 has three concepts for conditional flow processing:

**Branching conditionals** Functions that carry out a test and then execute, depending on its result, either the code supplied as the  $\langle true\ code \rangle$  or the  $\langle false\ code \rangle$ . These arguments are denoted with T and F, respectively. An example would be

```
\cs_if_free:cTF \{abc\} \{\langle true\ code \rangle\} \{\langle false\ code \rangle\}
```

a function that will turn the first argument into a control sequence (since it's marked as c) then checks whether this control sequence is still free and then depending on the result carry out the code in the second argument (true case) or in the third argument (false case).

These type of functions are known as "conditionals"; whenever a TF function is defined it will usually be accompanied by T and F functions as well. These are provided for convenience when the branch only needs to go a single way. Package writers are free to choose which types to define but the kernel definitions will always provide all three versions.

Important to note is that these branching conditionals with  $\langle true\ code \rangle$  and/or  $\langle false\ code \rangle$  are always defined in a way that the code of the chosen alternative can operate on following tokens in the input stream.

These conditional functions may or may not be fully expandable, but if they are expandable they will be accompanied by a "predicate" for the same test as described below.

**Predicates** "Predicates" are functions that return a special type of boolean value which can be tested by the boolean expression parser. All functions of this type are expandable and have names that end with \_p in the description part. For example,

```
\cs_if_free_p:N
```

would be a predicate function for the same type of test as the conditional described above. It would return "true" if its argument (a single token denoted by  $\mathbb{N}$ ) is still free for definition. It would be used in constructions like

```
\label{local_interpolar_state} $$ \cs_if_free_p:N \l_tmpz_tl || \cs_if_free_p:N \g_tmpz_tl \\ {\true \ code} $$ {\del{local_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpolar_interpo
```

For each predicate defined, a "branching conditional" will also exist that behaves like a conditional described above.

**Primitive conditionals** There is a third variety of conditional, which is the original concept used in plain  $T_EX$  and  $I^AT_EX 2_{\varepsilon}$ . Their use is discouraged in expl3 (although still used in low-level definitions) because they are more fragile and in many cases require more expansion control (hence more code) than the two types of conditionals described above.

\c\_true\_bool \c\_false\_bool Constants that represent true and false, respectively. Used to implement predicates.

## 5.1 Tests on control sequences

```
\cs_if_eq_p:NN \{\langle cs_1 \rangle\} \{\langle cs_2 \rangle\}
  \cs_if_eq_p:NN *
                           \cs_{if}_{eq:NNTF} \{\langle cs_1 \rangle\} \{\langle cs_2 \rangle\} \{\langle true\ code \rangle\} \{\langle false\ code \rangle\}
  \cs_if_eq:NNTF
                           Compares the definition of two \langle control\ sequences \rangle and is logically true the same, i.e. if
                            they have exactly the same definition when examined with \cs_show:N.
\cs_if_exist_p:N *
                           \verb|\cs_if_exist_p:N| \langle control sequence \rangle|
                           \cs_{if}=xist:NTF \ (control \ sequence) \ \{(true \ code)\} \ \{(false \ code)\}
\cs_if_exist_p:c
\cs_if_exist:NTF
                           Tests whether the \langle control\ sequence \rangle is currently defined (whether as a function or another
\cs_if_exist:cTF
                           control sequence type). Any valid definition of \langle control \ sequence \rangle will evaluate as true.
 \cs_if_free_p:N *
                            \cs_if_free_p:N \( control \) sequence \( \)
                           \cs_{if\_free:NTF} \ \langle control \ sequence \rangle \ \{\langle true \ code \rangle\} \ \{\langle false \ code \rangle\}
 \cs_if_free_p:c
 \cs_if_free:NTF
                           Tests whether the \langle control\ sequence \rangle is currently free to be defined. This test will be
 \cs_if_free:cTF
                           false if the (control sequence) currently exists (as defined by \cs_if_exist:N).
```

#### 5.2 Primitive conditionals

The  $\varepsilon$ -TEX engine itself provides many different conditionals. Some expand whatever comes after them and others don't. Hence the names for these underlying functions will often contain a :w part but higher level functions are often available. See for instance \int\_compare\_p:nNn which is a wrapper for \if\_int\_compare:w.

Certain conditionals deal with specific data types like boxes and fonts and are described there. The ones described below are either the universal conditionals or deal with control sequences. We will prefix primitive conditionals with \if\_.

\if\_true: always executes \( \lambda true code \), while \if\_false: always executes \( \lambda false code \). \( \text{reverse\_if:N reverses any two-way primitive conditional. \else: and \fi: delimit the branches of the conditional. The function \or: is documented in |3int and used in case switches.

**TEXhackers note:** These are equivalent to their corresponding TEX primitive conditionals; TEX's TEX

```
\label{liminary} $$ \inf_{meaning:w} \langle arg_1 \rangle \langle arg_2 \rangle \langle true\ code \rangle \le \langle false\ code \rangle \\ $$ if: $$ \end{substitute} $$ \end{
```

\if\_meaning:w executes  $\langle true\ code \rangle$  when  $\langle arg_1 \rangle$  and  $\langle arg_2 \rangle$  are the same, otherwise it executes  $\langle false\ code \rangle$ .  $\langle arg_1 \rangle$  and  $\langle arg_2 \rangle$  could be functions, variables, tokens; in all cases the unexpanded definitions are compared.

TEXhackers note: This is TEX's \ifx.

\if:w \*
\if\_charcode:w \*
\if\_catcode:w \*

These conditionals will expand any following tokens until two unexpandable tokens are left. If you wish to prevent this expansion, prefix the token in question with \exp\_not:N. \if\_catcode:w tests if the category codes of the two tokens are the same whereas \if:w tests if the character codes are identical. \if\_charcode:w is an alternative name for \if:w.

\if\_cs\_exist:N \*
\if\_cs\_exist:w \*

```
\label{linear_code} $$ \left( \frac{cs}{csex} \right) \le \frac{code}{code} $$ if_{cs_exist:w} \left( \frac{cs_exist:w}{cs_exist:w} \right) \le \frac{code}{code} $$ if_{cs_exist:w} \left( \frac{code}{code} \right) = \frac{code}{c
```

Check if  $\langle cs \rangle$  appears in the hash table or if the control sequence that can be formed from  $\langle tokens \rangle$  appears in the hash table. The latter function does not turn the control sequence in question into  $\scan_stop:!$  This can be useful when dealing with control sequences which cannot be entered as a single token.

\if\_mode\_horizontal: \*
\if\_mode\_vertical: \*
\if\_mode\_math: \*
\if\_mode\_inner: \*

 $\verb|\if_mode_horizontal: \langle true\ code \rangle \ \verb|\else: \langle false\ code \rangle \ \verb|\fi:$ 

Execute  $\langle true\ code \rangle$  if currently in horizontal mode, otherwise execute  $\langle false\ code \rangle$ . Similar for the other functions.

# 6 Internal kernel functions

\\_\_chk\_if\_exist\_cs:N
\\_\_chk\_if\_exist\_cs:c

 $\c \c chk_if_exist_cs:N\ \langle cs \rangle$ 

This function checks that  $\langle cs \rangle$  exists according to the criteria for  $\cs_{if}_{exist_p:N}$ , and if not raises a kernel-level error.

\\_\_chk\_if\_free\_cs:N
\\_\_chk\_if\_free\_cs:c

 $\c \c chk_iffree_cs:N\ \langle cs \rangle$ 

This function checks that  $\langle cs \rangle$  is free according to the criteria for  $\c jif_free_p:N$ , and if not raises a kernel-level error.

\\_\_chk\_if\_exist\_var:N

```
\c chk_if_exist_var:N \langle var \rangle
```

This function checks that  $\langle var \rangle$  is defined according to the criteria for \cs\_if\_free\_p:N, and if not raises a kernel-level error. This function is only created if the package option check-declarations is active.

\\_\_chk\_log:x

```
\verb|\color=chk_log:x {$\langle message\ text \rangle$}|
```

If the log-functions option is active, this function writes the  $\langle message\ text \rangle$  to the log file using  $\iow_log:x$ . Otherwise, the  $\langle message\ text \rangle$  is ignored using  $\iow_log:x$ .

\\_\_chk\_suspend\_log:
\\_\_chk\_resume\_log:

```
\__chk_suspend_log: ... \__chk_log:x ... \__chk_resume_log:
```

Any \\_\_chk\_log:x command between \\_\_chk\_suspend\_log: and \\_\_chk\_resume\_log: is suppressed. These commands can be nested.

\\_\_cs\_count\_signature:N

\\_\_cs\_count\_signature:N \( function \)

\_cs\_count\_signature:c

Splits the  $\langle function \rangle$  into the  $\langle name \rangle$  (i.e. the part before the colon) and the  $\langle signature \rangle$  (i.e. after the colon). The  $\langle number \rangle$  of tokens in the  $\langle signature \rangle$  is then left in the input stream. If there was no  $\langle signature \rangle$  then the result is the marker value -1.

\\_\_cs\_split\_function:NN

\\_\_cs\_split\_function:NN \( function \) \( \( processor \) \)

Splits the  $\langle function \rangle$  into the  $\langle name \rangle$  (i.e. the part before the colon) and the  $\langle signature \rangle$  (i.e. after the colon). This information is then placed in the input stream after the  $\langle processor \rangle$  function in three parts: the  $\langle name \rangle$ , the  $\langle signature \rangle$  and a logic token indicating if a colon was found (to differentiate variables from function names). The  $\langle name \rangle$  will not include the escape character, and both the  $\langle name \rangle$  and  $\langle signature \rangle$  are made up of tokens with category code 12 (other). The  $\langle processor \rangle$  should be a function with argument specification: nnN (plus any trailing arguments needed).

\\_cs\_get\_function\_name:N

\\_\_cs\_get\_function\_name:N \( function \)

Splits the  $\langle function \rangle$  into the  $\langle name \rangle$  (i.e. the part before the colon) and the  $\langle signature \rangle$  (i.e. after the colon). The  $\langle name \rangle$  is then left in the input stream without the escape character present made up of tokens with category code 12 (other).

 $\_$ \_cs\_get\_function\_signature:N  $\star$ 

\\_\_cs\_get\_function\_signature:N \( function \)

Splits the  $\langle function \rangle$  into the  $\langle name \rangle$  (i.e. the part before the colon) and the  $\langle signature \rangle$  (i.e. after the colon). The  $\langle signature \rangle$  is then left in the input stream made up of tokens with category code 12 (other).

\\_\_cs\_tmp:w

Function used for various short-term usages, for instance defining functions whose definition involves tokens which are hard to insert normally (spaces, characters with category other).

\\_\_kernel\_register\_show:N
\\_\_kernel\_register\_show:c

 $\verb|\climation| \label{lem:lem:now:N} \end{|\climater|} $$ \climater| \climat$ 

Used to show the contents of a TEX register at the terminal, formatted such that internal parts of the mechanism are not visible.

\\_\_prg\_case\_end:nw >

\\_prg\_case\_end:nw { $\langle code \rangle$ }  $\langle tokens \rangle$  \q\_mark { $\langle true\ code \rangle$ } \q\_mark { $\langle false\ code \rangle$ } \q\_stop

Used to terminate case statements (\int\_case:nnTF, etc.) by removing trailing  $\langle tokens \rangle$  and the end marker \q\_stop, inserting the  $\langle code \rangle$  for the successful case (if one is found) and either the true code or false code for the over all outcome, as appropriate.

#### Part V

# The l3expan package Argument expansion

This module provides generic methods for expanding TeX arguments in a systematic manner. The functions in this module all have prefix exp.

Not all possible variations are implemented for every base function. Instead only those that are used within the LATEX3 kernel or otherwise seem to be of general interest are implemented. Consult the module description to find out which functions are actually defined. The next section explains how to define missing variants.

#### 1 Defining new variants

The definition of variant forms for base functions may be necessary when writing new functions or when applying a kernel function in a situation that we haven't thought of before.

Internally preprocessing of arguments is done with functions from the \exp\_ module. They all look alike, an example would be \exp\_args:NNo. This function has three arguments, the first and the second are a single tokens, while the third argument should be given in braces. Applying \exp\_args:NNo will expand the content of third argument once before any expansion of the first and second arguments. If \seq\_gpush:No was not defined it could be coded in the following way:

```
\exp_args:NNo \seq_gpush:Nn
\g_file_name_stack
\l_tmpa_t1
```

In other words, the first argument to \exp\_args:NNo is the base function and the other arguments are preprocessed and then passed to this base function. In the example the first argument to the base function should be a single token which is left unchanged while the second argument is expanded once. From this example we can also see how the variants are defined. They just expand into the appropriate \exp\_ function followed by the desired base function, e.g.

```
\cs_new_nopar:Npn \seq_gpush:No { \exp_args:NNo \seq_gpush:Nn }
```

Providing variants in this way in style files is uncritical as the \cs\_new\_nopar:Npn function will silently accept definitions whenever the new definition is identical to an already given one. Therefore adding such definition to later releases of the kernel will not make such style files obsolete.

The steps above may be automated by using the function \cs\_generate\_-variant:Nn, described next.

# 2 Methods for defining variants

\cs\_generate\_variant:Nn

Updated: 2015-08-06

\cs\_generate\_variant: Nn \(\rangle parent control sequence \) \{\(\rangle variant argument specifiers \rangle \}\)

This function is used to define argument-specifier variants of the  $\langle parent\ control\ sequence \rangle$  for LaTeX3 code-level macros. The  $\langle parent\ control\ sequence \rangle$  is first separated into the  $\langle base\ name \rangle$  and  $\langle original\ argument\ specifier \rangle$ . The comma-separated list of  $\langle variant\ argument\ specifiers \rangle$  is then used to define variants of the  $\langle original\ argument\ specifier \rangle$  where these are not already defined. For each  $\langle variant \rangle$  given, a function is created which will expand its arguments as detailed and pass them to the  $\langle parent\ control\ sequence \rangle$ . So for example

```
\cs_set:Npn \foo:Nn #1#2 { code here }
\cs_generate_variant:Nn \foo:Nn { c }
```

will create a new function \foo:cn which will expand its first argument into a control sequence name and pass the result to \foo:Nn. Similarly

```
\cs_generate_variant:Nn \foo:Nn { NV , cV }
```

would generate the functions foo:NV and foo:cV in the same way. The  $cs_generate_variant:Nn$  function can only be applied if the  $\langle parent\ control\ sequence \rangle$  is already defined. If the  $\langle parent\ control\ sequence \rangle$  is protected then the new sequence will also be protected. The  $\langle variant \rangle$  is created globally, as is any  $exp_args:N\langle variant \rangle$  function needed to carry out the expansion.

# 3 Introducing the variants

The available internal functions for argument expansion come in two flavours, some of them are faster then others. Therefore it is usually best to follow the following guidelines when defining new functions that are supposed to come with variant forms:

- Arguments that might need expansion should come first in the list of arguments to make processing faster.
- Arguments that should consist of single tokens should come first.
- Arguments that need full expansion (*i.e.*, are denoted with x) should be avoided if possible as they can not be processed expandably, *i.e.*, functions of this type will not work correctly in arguments that are themselves subject to x expansion.
- In general, unless in the last position, multi-token arguments n, f, and o will need special processing when more than one argument is being expanded. This special processing is not fast. Therefore it is best to use the optimized functions, namely those that contain only N, c, V, and v, and, in the last position, o, f, with possible trailing N or n, which are not expanded.

The V type returns the value of a register, which can be one of t1, num, int, skip, dim, toks, or built-in TEX registers. The v type is the same except it first creates a control sequence out of its argument before returning the value. This recent addition to the argument specifiers may shake things up a bit as most places where o is used will be replaced by V. The documentation you are currently reading will therefore require a fair bit of re-writing.

In general, the programmer should not need to be concerned with expansion control. When simply using the content of a variable, functions with a V specifier should be used. For those referred to by (cs)name, the v specifier is available for the same purpose. Only when specific expansion steps are needed, such as when using delimited arguments, should the lower-level functions with o specifiers be employed.

The f type is so special that it deserves an example. It is typically used in contexts where only expandable commands are allowed. Then x-expansion cannot be used, and f-expansion provides an alternative that expands as much as can be done in such contexts. For instance, say that we want to evaluate the integer expression 3+4 and pass the result 7 as an argument to an expandable function \example:n. For this, one should define a variant using \cs\_generate\_variant:Nn \example:n { f }, then do

```
\example:f { \int_eval:n { 3 + 4 } }
```

Note that x-expansion would also expand \int\_eval:n fully to its result 7, but the variant \example:x cannot be expandable. Note also that o-expansion would not expand \int\_eval:n fully to its result since that function requires several expansions. Besides the fact that x-expansion is protected rather than expandable, another difference between f-expansion and x-expansion is that f-expansion expands tokens from the beginning and stops as soon as a non-expandable token is encountered, while x-expansion continues expanding further tokens. Thus, for instance

```
\example:f { \int eval:n { 1 + 2 } , \int eval:n { 3 + 4 }
```

will result in the call  $\ensuremath{\mbox{example:n } \{ 3 , \int_eval:n \{ 3 + 4 \} \} }$  while using  $\ensuremath{\mbox{example:x}}$  instead results in  $\ensuremath{\mbox{example:n}} \{ 3 , 7 \}$  at the cost of being protected. If you use this type of expansion in conditional processing then you should stick to using TF type functions only as it does not try to finish any  $\ensuremath{\mbox{if...}}$  \fi: itself!

If is important to note that both f- and o-type expansion are concerned with the expansion of tokens from left to right in their arguments. In particular, o-type expansion applies to the first *token* in the argument it receives: it is conceptually similar to

```
\exp_after:wN <base function> \exp_after:wN { <argument> }
```

At the same time, f-type expansion stops at the emphfirst non-expandable token. This means for example that both

```
\tl_set:No \l_tmpa_tl { { \l_tmpa_tl } }
and
```

\tl\_set:Nf \l\_tmpa\_tl { { \l\_tmpa\_tl } }

leave \1\_tmpa\_t1 unchanged: { is the first token in the argument and is non-expandable.

### 4 Manipulating the first argument

These functions are described in detail: expansion of multiple tokens follows the same rules but is described in a shorter fashion.

\exp\_args:No

```
\exp_args:No \( \frac{function}{\tangle} \ \{ \tankers} \} \ \dots
```

This function absorbs two arguments (the  $\langle function \rangle$  name and the  $\langle tokens \rangle$ ). The  $\langle tokens \rangle$  are expanded once, and the result is inserted in braces into the input stream after reinsertion of the  $\langle function \rangle$ . Thus the  $\langle function \rangle$  may take more than one argument: all others will be left unchanged.

\exp\_args:Nc \*
\exp\_args:cc \*

```
\exp_args:Nc \( \) \{\( \tau \) \}
```

This function absorbs two arguments (the  $\langle function \rangle$  name and the  $\langle tokens \rangle$ ). The  $\langle tokens \rangle$  are expanded until only characters remain, and are then turned into a control sequence. (An internal error will occur if such a conversion is not possible). The result is inserted into the input stream *after* reinsertion of the  $\langle function \rangle$ . Thus the  $\langle function \rangle$  may take more than one argument: all others will be left unchanged.

The :cc variant constructs the  $\langle function \rangle$  name in the same manner as described for the  $\langle tokens \rangle$ .

\exp\_args:NV

```
\exp_args:NV \( function \) \( \variable \)
```

This function absorbs two arguments (the names of the  $\langle function \rangle$  and the  $\langle variable \rangle$ ). The content of the  $\langle variable \rangle$  are recovered and placed inside braces into the input stream after reinsertion of the  $\langle function \rangle$ . Thus the  $\langle function \rangle$  may take more than one argument: all others will be left unchanged.

\exp\_args:Nv

```
\exp_args:Nv \(\frac{function}{\tancel{tokens}}\)
```

This function absorbs two arguments (the  $\langle function \rangle$  name and the  $\langle tokens \rangle$ ). The  $\langle tokens \rangle$  are expanded until only characters remain, and are then turned into a control sequence. (An internal error will occur if such a conversion is not possible). This control sequence should be the name of a  $\langle variable \rangle$ . The content of the  $\langle variable \rangle$  are recovered and placed inside braces into the input stream after reinsertion of the  $\langle function \rangle$ . Thus the  $\langle function \rangle$  may take more than one argument: all others will be left unchanged.

\exp\_args:Nf

```
\verb|\exp_args:Nf| \langle function \rangle | \{\langle tokens \rangle\}|
```

This function absorbs two arguments (the  $\langle function \rangle$  name and the  $\langle tokens \rangle$ ). The  $\langle tokens \rangle$  are fully expanded until the first non-expandable token or space is found, and the result is inserted in braces into the input stream *after* reinsertion of the  $\langle function \rangle$ . Thus the  $\langle function \rangle$  may take more than one argument: all others will be left unchanged.

```
\exp_args:Nx
```

```
\ensuremath{\texttt{\chi}} = \ensuremath{\texttt{\chi}} = \ensuremath{\texttt{\chi}} = \ensuremath{\texttt{\chi}} = \ensuremath{\texttt{(function)}} \ensuremath{\chi} \ensuremath{\chi}
```

This function absorbs two arguments (the  $\langle function \rangle$  name and the  $\langle tokens \rangle$ ) and exhaustively expands the  $\langle tokens \rangle$  second. The result is inserted in braces into the input stream after reinsertion of the  $\langle function \rangle$ . Thus the  $\langle function \rangle$  may take more than one argument: all others will be left unchanged.

#### 5 Manipulating two arguments

These optimized functions absorb three arguments and expand the second and third as detailed by their argument specifier. The first argument of the function is then the next item on the input stream, followed by the expansion of the second and third arguments.

These functions absorb three arguments and expand the second and third as detailed by their argument specifier. The first argument of the function is then the next item on the input stream, followed by the expansion of the second and third arguments. These functions need special (slower) processing.

\exp\_args:Nx
\exp\_args:Ncx
\exp\_args:Nnx
\exp\_args:(Nox|Nxo|Nxx)

```
\verb|\exp_args:NNx| \langle token_1 \rangle | \langle token_2 \rangle | \{\langle tokens \rangle\}|
```

These functions absorb three arguments and expand the second and third as detailed by their argument specifier. The first argument of the function is then the next item on the input stream, followed by the expansion of the second and third arguments. These functions are not expandable.

### 6 Manipulating three arguments

These optimized functions absorb four arguments and expand the second, third and fourth as detailed by their argument specifier. The first argument of the function is then the next item on the input stream, followed by the expansion of the second argument, etc.

```
\exp_args:NNoo *
\exp_args:NNno *
\exp_args:Nnoo *
\exp_args:Nooo *
\exp_args:Nnnc *
```

```
\verb|\exp_args:NNoo | \langle token_1 \rangle | \langle token_2 \rangle | \{\langle token_3 \rangle\} | \{\langle token_5 \rangle\}|
```

These functions absorb four arguments and expand the second, third and fourth as detailed by their argument specifier. The first argument of the function is then the next item on the input stream, followed by the expansion of the second argument, *etc*. These functions need special (slower) processing.

```
\exp_args:NNNx
\exp_args:Nccx
\exp_args:NNnx
\exp_args:(NNox|Ncnx)
\exp_args:Nnnx
\exp_args:(Nnox|Noox)
```

```
\texttt{\converge}: \texttt{NNnx} \ \langle \texttt{token}_1 \rangle \ \langle \texttt{token}_2 \rangle \ \{ \langle \texttt{tokens}_1 \rangle \} \ \{ \langle \texttt{tokens}_2 \rangle \}
```

These functions absorb four arguments and expand the second, third and fourth as detailed by their argument specifier. The first argument of the function is then the next item on the input stream, followed by the expansion of the second argument, etc.

New: 2015-08-12

## 7 Unbraced expansion

These functions absorb the number of arguments given by their specification, carry out the expansion indicated and leave the results in the input stream, with the last argument not surrounded by the usual braces. Of these, the :Nno, :Noo, and :Nfo variants need special (slower) processing.

**TEXhackers note:** As an optimization, the last argument is unbraced by some of those functions before expansion. This can cause problems if the argument is empty: for instance, \exp\_last\_unbraced:Nf \foo\_bar:w { } \q\_stop leads to an infinite loop, as the quark is f-expanded.

\exp\_last\_unbraced:Nx

```
\verb|\exp_last_unbraced:Nx| \langle function \rangle | \{\langle tokens \rangle\}|
```

This functions fully expands the  $\langle tokens \rangle$  and leaves the result in the input stream after reinsertion of  $\langle function \rangle$ . This function is not expandable.

```
\exp_last_two_unbraced:Noo * \exp_last_two_unbraced:Noo \(\lambda tokens_1\rangle \lambda (tokens_2\rangle)\)
```

This function absorbs three arguments and expand the second and third once. The first argument of the function is then the next item on the input stream, followed by the expansion of the second and third arguments, which are not wrapped in braces. This function needs special (slower) processing.

```
\exp_after:wN ★ \exp_after:wN ⟨token<sub>1</sub>⟩ ⟨token<sub>2</sub>⟩
```

Carries out a single expansion of  $\langle token_2 \rangle$  (which may consume arguments) prior to the expansion of  $\langle token_1 \rangle$ . If  $\langle token_2 \rangle$  is a TEX primitive, it will be executed rather than expanded, while if  $\langle token_2 \rangle$  has not expansion (for example, if it is a character) then it will be left unchanged. It is important to notice that  $\langle token_1 \rangle$  may be any single token, including group-opening and -closing tokens ( $\{ \text{ or } \}$  assuming normal TEX category codes). Unless specifically required, expansion should be carried out using an appropriate argument specifier variant or the appropriate  $\ensuremath{\backslash} \exp_{\texttt{arg}} \ensuremath{\mathbb{N}}$  function.

TEXhackers note: This is the TEX primitive \expandafter renamed.

### 8 Preventing expansion

Despite the fact that the following functions are all about preventing expansion, they're designed to be used in an expandable context and hence are all marked as being 'expandable' since they themselves will not appear after the expansion has completed.

\exp\_not:N \*

\exp\_not:N \langle token \rangle

Prevents expansion of the  $\langle token \rangle$  in a context where it would otherwise be expanded, for example an x-type argument.

TEXhackers note: This is the TEX \noexpand primitive.

\exp\_not:c

\exp\_not:c  $\{\langle tokens \rangle\}$ 

Expands the  $\langle tokens \rangle$  until only unexpandable content remains, and then converts this into a control sequence. Further expansion of this control sequence is then inhibited.

\exp\_not:n \*

 $\exp_{not:n} \{\langle tokens \rangle\}$ 

Prevents expansion of the  $\langle tokens \rangle$  in a context where they would otherwise be expanded, for example an x-type argument.

**TEXhackers note:** This is the  $\varepsilon$ -TEX \unexpanded primitive. Hence its argument must be surrounded by braces.

\exp\_not:V

\exp\_not:V \( \text{variable} \)

Recovers the content of the  $\langle variable \rangle$ , then prevents expansion of this material in a context where it would otherwise be expanded, for example an x-type argument.

\exp\_not:v \*

 $\exp_{\text{not:v}} \{\langle tokens \rangle\}$ 

Expands the  $\langle tokens \rangle$  until only unexpandable content remains, and then converts this into a control sequence (which should be a  $\langle variable \rangle$  name). The content of the  $\langle variable \rangle$  is recovered, and further expansion is prevented in a context where it would otherwise be expanded, for example an x-type argument.

\exp\_not:o \*

\exp\_not:o  $\{\langle tokens \rangle\}$ 

Expands the  $\langle tokens \rangle$  once, then prevents any further expansion in a context where they would otherwise be expanded, for example an x-type argument.

\exp\_not:f \*

\exp\_not:f  $\{\langle tokens \rangle\}$ 

Expands  $\langle tokens \rangle$  fully until the first unexpandable token is found. Expansion then stops, and the result of the expansion (including any tokens which were not expanded) is protected from further expansion.

```
\exp_stop_f:
```

```
\foo_bar:f { \langle tokens \rangle \text{ \text{more tokens} }
```

Updated: 2011-06-03

This function terminates an f-type expansion. Thus if a function  $foo_bar:f$  starts an f-type expansion and all of  $\langle tokens \rangle$  are expandable  $\exp_stop_f:$  will terminate the expansion of tokens even if  $\langle more\ tokens \rangle$  are also expandable. The function itself is an implicit space token. Inside an x-type expansion, it will retain its form, but when typeset it produces the underlying space ( $\Box$ ).

#### 9 Controlled expansion

The expl3 language makes all efforts to hide the complexity of TeX expansion from the programmer by providing concepts that evaluate/expand arguments of functions prior to calling the "base" functions. Thus, instead of using many \expandafter calls and other trickery it is usually a matter of choosing the right variant of a function to achieve a desired result.

Of course, deep down TEX is using expansion as always and there are cases where a programmer needs to control that expansion directly; typical situations are basic data manipulation tools. This section documents the functions for that level. You will find these commands used throughout the kernel code, but we hope that outside the kernel there will be little need to resort to them. Instead the argument manipulation methods document above should usually be sufficient.

While \exp\_after:wN expands one token (out of order) it is sometimes necessary to expand several tokens in one go. The next set of commands provide this functionality. Be aware that it is absolutely required that the programmer has full control over the tokens to be expanded, i.e., it is not possible to use these functions to expand unknown input as part of \( \lambda expandable-tokens \rangle \) as that will break badly if unexpandable tokens are encountered in that place!

\exp:w \*
\exp\_end: \*

\exp:w \(\left(\expandable-tokens\right)\) \exp\_end:

New: 2015-08-23

Expands  $\langle expandable\text{-}tokens \rangle$  until reaching  $\langle exp\_end$ : at which point expansion stops. The full expansion of  $\langle expandable\text{-}tokens \rangle$  has to be empty. If any token in  $\langle expandable\text{-}tokens \rangle$  or any token generated by expanding the tokens therein is not expandable the expansion will end prematurely and as a result  $\langle exp\_end$ : will be misinterpreted later on.<sup>2</sup>

In typical use cases the \exp\_end: will be hidden somewhere in the replacement text of \( \lambda expandable-tokens \rangle \) rather than being on the same expansion level than \exp:w, e.g., you may see code such as

```
\exp:w \@@_case:NnTF #1 {#2} { } { }
```

where somewhere during the expansion of \@@\_case:NnTF the \exp\_end: gets generated.

<sup>&</sup>lt;sup>2</sup>Due to the implementation you might get the character in position 0 in the current font (typically "'") in the output without any error message!

```
\exp:w
\exp_end_continue_f:w
```

New: 2015-08-23

\exp:w \( \text{expandable-tokens} \) \exp\_end\_continue\_f:w \( \text{further-tokens} \)

Expands \( \langle expandable-tokens \rangle \) until reaching \( \text{exp\_end\_continue\_f:w} \) at which point expansion continues as an f-type expansion expanding \( \langle further-tokens \rangle \) until an unexpandable token is encountered (or the f-type expansion is explicitly terminated by \( \text{exp\_-stop\_f:} \)). As with all f-type expansions a space ending the expansion will get removed.

The full expansion of  $\langle expandable\text{-}tokens\rangle$  has to be empty. If any token in  $\langle expandable\text{-}tokens\rangle$  or any token generated by expanding the tokens therein is not expandable the expansion will end prematurely and as a result  $\langle exp\_end\_continue\_f:w$  will be misinterpreted later on.<sup>3</sup>

In typical use cases  $\langle expandable\text{-}tokens \rangle$  contains no tokens at all, e.g., you will see code such as

```
\exp_after:wN { \exp:w \exp_end_continue_f:w #2 }
```

where the \exp\_after:wN triggers an f-expansion of the tokens in #2. For technical reasons this has to happen using two tokens (if they would be hidden inside another command \exp\_after:wN would only expand the command but not trigger any additional f-expansion).

You might wonder why there are two different approaches available, after all the effect of

```
\ensuremath{\texttt{expandable-tokens}}\ \ensuremath{\texttt{exp}\_\texttt{end}}:
```

can be alternatively achieved through an f-type expansion by using \exp stop f:, i.e.

```
\exp:w \exp_end_continue_f:w \( expandable-tokens \) \exp_stop_f:
```

The reason is simply that the first approach is slightly faster (one less token to parse and less expansion internally) so in places where such performance really matters and where we want to explicitly stop the expansion at a defined point the first form is preferable.

\exp:w \*
\exp\_end\_continue\_f:nw \*

New: 2015-08-23

 $\verb|\exp:w| \langle expandable-tokens| \rangle \\ | exp_end_continue_f:nw| \langle further-tokens| \rangle \\ | exp_end_continue_f:nw| \langle further-$ 

The difference to  $\ensuremath{\mbox{exp\_end\_continue\_f:w}}$  is that we first we pick up an argument which is then returned to the input stream. If  $\ensuremath{\mbox{further-tokens}}\xspace$  starts with a brace group then the braces are removed. If on the other hand it starts with space tokens then these space tokens are removed while searching for the argument. Thus such space tokens will not terminate the f-type expansion.

#### 10 Internal functions and variables

\l\_\_exp\_internal\_tl

The \exp\_ module has its private variables to temporarily store results of the argument expansion. This is done to avoid interference with other functions using temporary variables.

<sup>&</sup>lt;sup>3</sup>In this particular case you may get a character into the output as well as an error message.

```
\::n \cs_set_nopar:Npn \exp_args:Ncof { \::c \::o \::f \::: }
\::N \::p \LATEX3 approach as this makes them more readily visible in the log and so forth.
\::c \::c \::c \::v \::v \::v \:::v \:::
```

#### Part VI

# The **I3prg** package Control structures

Conditional processing in LATEX3 is defined as something that performs a series of tests, possibly involving assignments and calling other functions that do not read further ahead in the input stream. After processing the input, a *state* is returned. The states returned are  $\langle true \rangle$  and  $\langle false \rangle$ .

LATEX3 has two forms of conditional flow processing based on these states. The first form is predicate functions that turn the returned state into a boolean  $\langle true \rangle$  or  $\langle false \rangle$ . For example, the function \cs\_if\_free\_p:N checks whether the control sequence given as its argument is free and then returns the boolean  $\langle true \rangle$  or  $\langle false \rangle$  values to be used in testing with \if\_predicate:w or in functions to be described below. The second form is the kind of functions choosing a particular argument from the input stream based on the result of the testing as in \cs\_if\_free:NTF which also takes one argument (the N) and then executes either true or false depending on the result.

 $T_EX$  hackers note: The arguments are executed after exiting the underlying  $\inf...\inf$ : structure.

## 1 Defining a set of conditional functions

\prg\_new\_conditional:Npnn \prg\_new\_conditional:Npnn \prg\_set\_conditional:Npnn \prg\_set\_conditional:Npnn

Updated: 2012-02-06

These functions create a family of conditionals using the same  $\{\langle code \rangle\}$  to perform the test created. Those conditionals are expandable if  $\langle code \rangle$  is. The new versions will check for existing definitions and perform assignments globally  $(cf. \cs_new:Npn)$  whereas the set versions do no check and perform assignments locally  $(cf. \cs_set:Npn)$ . The conditionals created are dependent on the comma-separated list of  $\langle conditions \rangle$ , which should be one or more of p, T, F and TF.

Updated: 2012-02-06

These functions create a family of protected conditionals using the same  $\{\langle code \rangle\}$  to perform the test created. The  $\langle code \rangle$  does not need to be expandable. The new version will check for existing definitions and perform assignments globally  $(cf. \cs_new:Npn)$  whereas the set version will not  $(cf. \cs_set:Npn)$ . The conditionals created are depended on the comma-separated list of  $\langle conditions \rangle$ , which should be one or more of T, F and TF (not p).

The conditionals are defined by \prg\_new\_conditional:Npnn and friends as:

- \\name\\_p:\larg spec\ a predicate function which will supply either a logical true or logical false. This function is intended for use in cases where one or more logical tests are combined to lead to a final outcome. This function cannot be defined for protected conditionals.
- \\name\:\langle arg spec \rangle T a function with one more argument than the original \( \langle arg \) spec \rangle demands. The \( \langle true \) branch \( \rangle \) code in this additional argument will be left on the input stream only if the test is true.
- \\( name \): \( arg spec \)F a function with one more argument than the original \( arg spec \) demands. The \( false branch \) code in this additional argument will be left on the input stream only if the test is false.
- \\name\:\langle arg spec\TF a function with two more argument than the original \(\langle arg spec\rangle\) demands. The \(\langle true branch\rangle\) code in the first additional argument will be left on the input stream if the test is true, while the \(\langle false branch\rangle\) code in the second argument will be left on the input stream if the test is false.

The  $\langle code \rangle$  of the test may use  $\langle parameters \rangle$  as specified by the second argument to  $prg_{set\_conditional:Npnn}$ : this should match the  $\langle argument\ specification \rangle$  but this is not enforced. The Nnn versions infer the number of arguments from the argument specification given  $(cf. \cs_new:Nn,\ etc.)$ . Within the  $\langle code \rangle$ , the functions  $prg_return_true:$  and  $prg_return_true:$  are used to indicate the logical outcomes of the test.

An example can easily clarify matters here:

```
\fi:
\fi:
}
```

This defines the function \foo\_if\_bar\_p:NN, \foo\_if\_bar:NNTF and \foo\_if\_bar:NNT but not \foo\_if\_bar:NNF (because F is missing from the \( \chinom{conditions} \) list). The return statements take care of resolving the remaining \else: and \fi: before returning the state. There must be a return statement for each branch; failing to do so will result in erroneous output if that branch is executed.

```
\prg_new_eq_conditional:NNn \quad \prg_new_eq_conditional:NNn \quad \\ \prg_set_eq_conditional:NNn \quad \\ \\ \prg_set_e
```

These functions copy a family of conditionals. The new version will check for existing definitions (cf. \cs\_new:Npn) whereas the set version will not (cf. \cs\_set:Npn). The conditionals copied are depended on the comma-separated list of  $\langle conditions \rangle$ , which should be one or more of p, T, F and TF.

```
\prg_return_true: *
\prg_return_false: *
```

```
\prg_return_true:
\prg_return_false:
```

These 'return' functions define the logical state of a conditional statement. They appear within the code for a conditional function generated by \prg\_set\_conditional:Npnn, etc, to indicate when a true or false branch should be taken. While they may appear multiple times each within the code of such conditionals, the execution of the conditional must result in the expansion of one of these two functions exactly once.

The return functions trigger what is internally an f-expansion process to complete the evaluation of the conditional. Therefore, after \prg\_return\_true: or \prg\_return\_-false: there must be no non-expandable material in the input stream for the remainder of the expansion of the conditional code. This includes other instances of either of these functions.

# 2 The boolean data type

This section describes a boolean data type which is closely connected to conditional processing as sometimes you want to execute some code depending on the value of a switch (e.g., draft/final) and other times you perhaps want to use it as a predicate function in an \if\_predicate:w test. The problem of the primitive \if\_false: and \if\_true: tokens is that it is not always safe to pass them around as they may interfere with scanning for termination of primitive conditional processing. Therefore, we employ two canonical booleans: \c\_true\_bool or \c\_false\_bool. Besides preventing problems as described above, it also allows us to implement a simple boolean parser supporting the logical operations And, Or, Not, etc. which can then be used on both the boolean type and predicate functions.

All conditional \bool\_ functions except assignments are expandable and expect the input to also be fully expandable (which will generally mean being constructed from predicate functions, possibly nested).

**TEXhackers note:** The bool data type is not implemented using the \iffalse/\iffrue primitives, in contrast to \newif, etc., in plain TEX, LATEX  $2\varepsilon$  and so on. Programmers should not base use of bool switches on any particular expectation of the implementation.

\bool\_new:N \bool\_new:N \langle boolean \rangle \bool\_new:c Creates a new  $\langle boolean \rangle$  or raises an error if the name is already taken. The declaration is global. The  $\langle boolean \rangle$  will initially be false. \bool\_set\_false:N \bool\_set\_false:N \langle boolean \rangle \bool\_set\_false:c Sets \(\langle boolean \rangle \) logically false. \bool\_gset\_false:N \bool\_gset\_false:c \bool\_set\_true:N \bool\_set\_true:N \langle boolean \rangle \bool\_set\_true:c Sets \(\langle boolean \rangle \) logically true. \bool\_gset\_true:N \bool\_gset\_true:c \bool\_set\_eq:NN  $\bool_{set_eq:NN \ \langle boolean_1 \rangle \ \langle boolean_2 \rangle}$ \bool\_set\_eq:(cN|Nc|cc) Sets the content of  $\langle boolean_1 \rangle$  equal to that of  $\langle boolean_2 \rangle$ . \bool\_gset\_eq:NN \bool\_gset\_eq:(cN|Nc|cc) \bool\_set:Nn \bool\_set:Nn \langle boolean \rangle \langle \langle boolexpr \rangle \rangle \bool\_set:cn Evaluates the (boolean expression) as described for \bool\_if:n(TF), and sets the \bool\_gset:Nn (boolean) variable to the logical truth of this evaluation. \bool\_gset:cn Updated: 2012-07-08 \bool\_if\_p:N \langle boolean \rangle \bool\_if\_p:N ★  $\verb|\bool_if:NTF| \langle boolean \rangle \ \{\langle true| code \rangle\} \ \{\langle false| code \rangle\}$ \bool\_if\_p:c \* \bool\_if:NTF ★ Tests the current truth of  $\langle boolean \rangle$ , and continues expansion based on this result. \bool\_if:cTF \* \bool\_show:N \bool\_show:N \langle boolean \rangle \bool\_show:c Displays the logical truth of the  $\langle boolean \rangle$  on the terminal. New: 2012-02-09 Updated: 2015-08-01 \bool\_show:n  $\verb|\bool_show:n {| \langle boolean expression \rangle|}$ Displays the logical truth of the  $\langle boolean\ expression \rangle$  on the terminal. New: 2012-02-09 Updated: 2015-08-07

```
\bool_if_exist_p:N \times \bool_if_exist_p:c \times \bool_if_exist:NTF \times \bool_if_exist:cTF \times \Bool_if_exist:cTF \times \Bool_if_exist:cTF \times \Bool_if_exist:cTF \times \Bool_if_exist.cTF \Bool_if_exist.cTF \times \Bool_if_exist.cTF \times
```

```
\label{local_policy} $$ \bool_if_exist_NTF $$ \bool_if_exist:NTF $$ \bool_ean $$ {\langle true \ code \rangle } $$ {\langle false \ code \rangle }$
```

Tests whether the  $\langle boolean \rangle$  is currently defined. This does not check that the  $\langle boolean \rangle$  really is a boolean variable.

\l\_tmpa\_bool
\l\_tmpb\_bool

A scratch boolean for local assignment. It is never used by the kernel code, and so is safe for use with any LATEX3-defined function. However, it may be overwritten by other non-kernel code and so should only be used for short-term storage.

\g\_tmpa\_bool \g\_tmpb\_bool

A scratch boolean for global assignment. It is never used by the kernel code, and so is safe for use with any LATEX3-defined function. However, it may be overwritten by other non-kernel code and so should only be used for short-term storage.

#### 3 Boolean expressions

As we have a boolean datatype and predicate functions returning boolean  $\langle true \rangle$  or  $\langle false \rangle$  values, it seems only fitting that we also provide a parser for  $\langle boolean\ expressions \rangle$ .

A boolean expression is an expression which given input in the form of predicate functions and boolean variables, return boolean  $\langle true \rangle$  or  $\langle false \rangle$ . It supports the logical operations And, Or and Not as the well-known infix operators &&, || and ! with their usual precedences (namely, && binds more tightly than ||). In addition to this, parentheses can be used to isolate sub-expressions. For example,

```
\int_compare_p:n { 1 = 1 } &&
  (
     \int_compare_p:n { 2 = 3 } ||
     \int_compare_p:n { 4 <= 4 } ||
     \str_if_eq_p:nn { abc } { def }
  ) &&
! \int_compare_p:n { 2 = 4 }</pre>
```

is a valid boolean expression.

At present, the infix operators && and | | perform lazy evaluation as well, but this will change in a future release.

```
\bool_if_p:n \star \bool_if:n\overline{TF} \star Updated: 2012-07-08
```

```
\begin{tabular}{ll} $$ \bool_if_p:n {\langle boolean\ expression \rangle} \\ \bool_if:nTF {\langle boolean\ expression \rangle} {\langle true\ code \rangle} {\langle false\ code \rangle} \\ \end{tabular}
```

Tests the current truth of  $\langle boolean\ expression \rangle$ , and continues expansion based on this result. The  $\langle boolean\ expression \rangle$  should consist of a series of predicates or boolean variables with the logical relationship between these defined using && ("And"), || ("Or"), ! ("Not") and parentheses. The logical Not applies to the next predicate or group.

```
\bool_not_p:n *
```

```
\bool_not_p:n {\langle boolean expression \rangle}
```

Updated: 2012-07-08

Function version of ! ( $\langle boolean\ expression \rangle$ ) within a boolean expression.

\bool\_xor\_p:nn \*

 $\bool_xor_p:nn \{\langle boolexpr_1 \rangle\} \{\langle boolexpr_2 \rangle\}$ 

Updated: 2012-07-08

Implements an "exclusive or" operation between two boolean expressions. There is no infix operation for this logical operator.

#### 4 Logical loops

Loops using either boolean expressions or stored boolean values.

\bool\_do\_until:Nn ☆ \bool\_do\_until:cn ☆

 $\verb|\bool_do_until:Nn| \langle boolean \rangle | \{\langle code \rangle\}|$ 

Places the  $\langle code \rangle$  in the input stream for TEX to process, and then checks the logical value of the  $\langle boolean \rangle$ . If it is false then the  $\langle code \rangle$  will be inserted into the input stream again and the process will loop until the  $\langle boolean \rangle$  is true.

\bool\_do\_while:Nn ☆ \bool\_do\_while:cn ☆

 $\bool_do_while:Nn \boolean \ \{\code\}\}$ 

Places the  $\langle code \rangle$  in the input stream for TEX to process, and then checks the logical value of the  $\langle boolean \rangle$ . If it is true then the  $\langle code \rangle$  will be inserted into the input stream again and the process will loop until the  $\langle boolean \rangle$  is false.

\bool\_until\_do:Nn ☆ \bool\_until\_do:cn ☆

 $\bool_until_do: Nn \ \langle boolean \rangle \ \{\langle code \rangle\}$ 

This function firsts checks the logical value of the  $\langle boolean \rangle$ . If it is **false** the  $\langle code \rangle$  is placed in the input stream and expanded. After the completion of the  $\langle code \rangle$  the truth of the  $\langle boolean \rangle$  is re-evaluated. The process will then loop until the  $\langle boolean \rangle$  is true.

\bool\_while\_do:Nn ☆ \bool\_while\_do:cn ☆

 $\bool_while_do: Nn \boolean \begin{cases} \{\langle code \end{cases} \}$ 

This function firsts checks the logical value of the  $\langle boolean \rangle$ . If it is true the  $\langle code \rangle$  is placed in the input stream and expanded. After the completion of the  $\langle code \rangle$  the truth of the  $\langle boolean \rangle$  is re-evaluated. The process will then loop until the  $\langle boolean \rangle$  is false.

\bool\_do\_until:nn ☆

 $\verb|\bool_do_until:nn| {$\langle boolean \ expression \rangle$} \ {$\langle code \rangle$}$ 

Updated: 2012-07-08

Places the  $\langle code \rangle$  in the input stream for TEX to process, and then checks the logical value of the  $\langle boolean\ expression \rangle$  as described for \bool\_if:nTF. If it is false then the  $\langle code \rangle$  will be inserted into the input stream again and the process will loop until the  $\langle boolean\ expression \rangle$  evaluates to true.

\bool\_do\_while:nn ☆

 $\bool_do_while:nn {\langle boolean \ expression \rangle} {\langle code \rangle}$ 

Updated: 2012-07-08

Places the  $\langle code \rangle$  in the input stream for  $T_EX$  to process, and then checks the logical value of the  $\langle boolean\ expression \rangle$  as described for  $\bool_if:nTF$ . If it is true then the  $\langle code \rangle$  will be inserted into the input stream again and the process will loop until the  $\langle boolean\ expression \rangle$  evaluates to false.

 $\verb|\bool_until_do:nn| & \verb|\bool_until_do:nn| {$\langle boolean \ expression \rangle$} \ {$\langle code \rangle$} \\$ 

Updated: 2012-07-08

This function firsts checks the logical value of the  $\langle boolean\ expression\rangle$  (as described for  $\bool_if:nTF$ ). If it is false the  $\langle code\rangle$  is placed in the input stream and expanded. After the completion of the  $\langle code\rangle$  the truth of the  $\langle boolean\ expression\rangle$  is re-evaluated. The process will then loop until the  $\langle boolean\ expression\rangle$  is true.

 $\verb|\bool_while_do:nn| & \verb|\bool_while_do:nn| {$\langle boolean \ expression \rangle$} \ {$\langle code \rangle$} \\$ 

Updated: 2012-07-08

This function firsts checks the logical value of the  $\langle boolean\ expression\rangle$  (as described for \bool\_if:nTF). If it is true the  $\langle code\rangle$  is placed in the input stream and expanded. After the completion of the  $\langle code\rangle$  the truth of the  $\langle boolean\ expression\rangle$  is re-evaluated. The process will then loop until the  $\langle boolean\ expression\rangle$  is false.

### 5 Producing multiple copies

 $\prg_replicate:nn * \prg_replicate:nn {$\langle integer expression \rangle$} {\langle tokens \rangle$}$ 

Updated: 2011-07-04

Evaluates the  $\langle integer\ expression \rangle$  (which should be zero or positive) and creates the resulting number of copies of the  $\langle tokens \rangle$ . The function is both expandable and safe for nesting. It yields its result after two expansion steps.

# 6 Detecting T<sub>E</sub>X's mode

Detects if T<sub>E</sub>X is currently in vertical mode.

```
\mode_if_horizontal_p:
\mode_if_horizontal_p:
                                        \mbox{\code_if\_horizontal:TF } \{\langle true\ code \rangle\} \ \{\langle false\ code \rangle\}
\mode_if_horizontal: TF
                                        Detects if TEX is currently in horizontal mode.
                                        \mode if inner p:
       \mode_if_inner_p:
                                        \mbox{mode\_if\_inner:TF } {\langle true \ code \rangle} \ {\langle false \ code \rangle}
        \mode_if_inner:TF
                                        Detects if TFX is currently in inner mode.
         \mode_if_math_p: *
                                        \mbox{\em mode_if_math:TF } \{\langle true\ code \rangle\} \ \{\langle false\ code \rangle\}
         \mbox{\mbox{$\mbox{mode\_if\_math:}$}} \
                                        Detects if T<sub>E</sub>X is currently in maths mode.
              Updated: 2011-09-05
                                        \mode_if_vertical_p:
   \mode_if_vertical_p: *
                                        \mbox{\ensuremath{\mbox{mode\_if\_vertical:TF}} } \{\mbox{\ensuremath{\mbox{\it true}}\ code}\} } \{\mbox{\ensuremath{\mbox{\it false}\ code}}\}
   \mode_if_vertical: TF
```

#### 7 Primitive conditionals

\if\_predicate:w \*

\if\_predicate:w \( \predicate \) \\ \text{true code} \\ \else: \( \false code \) \\ \fi:

This function takes a predicate function and branches according to the result. (In practice this function would also accept a single boolean variable in place of the  $\langle predicate \rangle$  but to make the coding clearer this should be done through  $\inf_{bool:N.}$ 

\if\_bool:N ★

 $\inj_bool:N \langle boolean \rangle \langle true\ code \rangle \else: \langle false\ code \rangle \fi:$ 

This function takes a boolean variable and branches according to the result.

#### 8 Internal programming functions

\group\_align\_safe\_begin: \group\_align\_safe\_end:

\group\_align\_safe\_begin:

. . .

Updated: 2011-08-11

\group\_align\_safe\_end:

These functions are used to enclose material in a TEX alignment environment within a specially-constructed group. This group is designed in such a way that it does not add brace groups to the output but does act as a group for the & token inside \halign. This is necessary to allow grabbing of tokens for testing purposes, as TEX uses group level to determine the effect of alignment tokens. Without the special grouping, the use of a function such as \peek\_after:Nw will result in a forbidden comparison of the internal \endtemplate token, yielding a fatal error. Each \group\_align\_safe\_begin: must be matched by a \group\_align\_safe\_end:, although this does not have to occur within the same function.

\\_\_prg\_break\_point:Nn 🔸

 $\proonup \proonup \$ 

Used to mark the end of a recursion or mapping: the functions  $\langle type \rangle_{map\_break}$ : and  $\langle type \rangle_{map\_break}$ : n use this to break out of the loop. After the loop ends, the  $\langle tokens \rangle$  are inserted into the input stream. This occurs even if the break functions are *not* applied:  $\_prg\_break\_point:Nn$  is functionally-equivalent in these cases to  $\use\_ii:nn$ .

\\_\_prg\_map\_break:Nn

 $\proonup \proonup \$ 

. . .

 $\proonup \proonup \$ 

Breaks a recursion in mapping contexts, inserting in the input stream the  $\langle user\ code \rangle$  after the  $\langle ending\ code \rangle$  for the loop. The function breaks loops, inserting their  $\langle ending\ code \rangle$ , until reaching a loop with the same  $\langle type \rangle$  as its first argument. This  $\langle type \rangle$ \_map\_break: argument is simply used as a recognizable marker for the  $\langle type \rangle$ .

\g\_\_prg\_map\_int

This integer is used by non-expandable mapping functions to track the level of nesting in force. The functions \\_\_prg\_map\_1:w, \\_\_prg\_map\_2:w, etc., labelled by \g\_\_prg\_map\_int hold functions to be mapped over various list datatypes in inline and variable mappings.

This copy of \prg\_do\_nothing: is used to mark the end of a fast short-term recursions: the function \\_\_prg\_break:n uses this to break out of the loop.

\[ \begin{align\*} \\_\_prg\_break: \\ \\_\_prg\_break:n \\ \\_\_prg\_break:n \\ \\ \\_prg\_break:n \\ \\ \\_prg\_break:n \\ \\ \\_prg\_break:Nn), and inserts \langle tokens \rangle in the input stream.

#### Part VII

# The **I3quark** package Quarks

#### 1 Introduction to quarks and scan marks

Two special types of constants in LATEX3 are "quarks" and "scan marks". By convention all constants of type quark start out with \q\_, and scan marks start with \s\_. Scan marks are for internal use by the kernel: they are not intended for more general use.

#### 1.1 Quarks

Quarks are control sequences that expand to themselves and should therefore never be executed directly in the code. This would result in an endless loop!

They are meant to be used as delimiter in weird functions, with the most command use case as the 'stop token' ( $i.e. \neq stop$ ). For example, when writing a macro to parse a user-defined date

```
\date_parse:n {19/June/1981}
one might write a command such as
\cs_new:Npn \date_parse:n #1 { \date_parse_aux:w #1 \q_stop }
\cs_new:Npn \date_parse_aux:w #1 / #2 / #3 \q_stop
{ <do something with the date> }
```

Quarks are sometimes also used as error return values for functions that receive erroneous input. For example, in the function \prop\_get:NnN to retrieve a value stored in some key of a property list, if the key does not exist then the return value is the quark \q\_no\_value. As mentioned above, such quarks are extremely fragile and it is imperative when using such functions that code is carefully written to check for pathological cases to avoid leakage of a quark into an uncontrolled environment.

Quarks also permit the following ingenious trick when parsing tokens: when you pick up a token in a temporary variable and you want to know whether you have picked up a particular quark, all you have to do is compare the temporary variable to the quark using \tl\_if\_eq:NNTF. A set of special quark testing functions is set up below. All the quark testing functions are expandable although the ones testing only single tokens are much faster. An example of the quark testing functions and their use in recursion can be seen in the implementation of \clist\_map\_function:NN.

#### 2 Defining quarks

\quark\_new:N \quark\_new:N \quark \

Creates a new  $\langle quark \rangle$  which expands only to  $\langle quark \rangle$ . The  $\langle quark \rangle$  will be defined globally, and an error message will be raised if the name was already taken.

 $\q_{stop}$  Used as a marker for delimited arguments, such as

\cs\_set:Npn \tmp:w #1#2 \q\_stop {#1}

\q\_mark Used as a marker for delimited arguments when \q\_stop is already in use.

Quark to mark a null value in structured variables or functions. Used as an end delimiter when this may itself may need to be tested (in contrast to \q\_stop, which is only ever used as a delimiter).

A canonical value for a missing value, when one is requested from a data structure. This is therefore used as a "return" value by functions such as \prop\_get:NnN if there is no data to return.

#### 3 Quark tests

The method used to define quarks means that the single token (N) tests are faster than the multi-token (n) tests. The later should therefore only be used when the argument can definitely take more than a single token.

```
\quark_if_nil_p:N * \qquad \qquad \\ \quark_if_nil:NTF * \qquad \\ \quark_if_nil:NTF \ \langle token \rangle \ \{\langle true\ code \rangle\} \ \{\langle false\ code \rangle\} \quark_if_nil:NTF \ \langle token \rangle \ \{\langle true\ code \rangle\} \ \\ \quark_if_nil:NTF \ \langle token \rangle \ \{\langle true\ code \rangle\} \ \\ \quark_if_nil:NTF \ \langle token \rangle \ \{\langle true\ code \rangle\} \ \\ \quark_if_nil:NTF \ \langle token \rangle \ \{\langle true\ code \rangle\} \ \\ \quark_if_nil:NTF \ \langle token \rangle \ \{\langle true\ code \rangle\} \ \\ \quark_if_nil:NTF \ \langle token \rangle \ \{\langle true\ code \rangle\} \ \\ \quark_if_nil:NTF \ \langle token \rangle \ \{\langle true\ code \rangle\} \ \\ \quark_if_nil:NTF \ \langle token \rangle \ \{\langle true\ code \rangle\} \ \\ \quark_if_nil:NTF \ \langle token \rangle \ \{\langle true\ code \rangle\} \ \\ \quark_if_nil:NTF \ \langle token \rangle \ \{\langle true\ code \rangle\} \ \\ \quark_if_nil:NTF \ \langle token \rangle \ \{\langle true\ code \rangle\} \ \\ \quark_if_nil:NTF \ \langle token \rangle \ \{\langle true\ code \rangle\} \ \\ \quark_if_nil:NTF \ \langle token \rangle \ \{\langle true\ code \rangle\} \ \\ \quark_if_nil:NTF \ \langle token \rangle \ \{\langle true\ code \rangle\} \ \\ \quark_if_nil:NTF \ \langle token \rangle \ \{\langle true\ code \rangle\} \ \\ \quark_if_nil:NTF \ \langle token \rangle \ \\ \quark_i
```

Tests if the  $\langle token \rangle$  is equal to  $\q_nil.$ 

 $\frac{\text{`quark\_if\_nil:nil:}}{\text{`quark\_if\_nil:}} (\circ | V) \underbrace{\text{TF}}_{\star}$  Tests if the  $\langle token \ list \rangle$  contains only  $\text{`q\_nil}$  (distinct from  $\langle token \ list \rangle$  being empty or containing  $\text{`q\_nil}$  plus one or more other tokens).

```
\quark_if_no_value_p:N \ \ \quark_if_no_value_p:N \ \code\rangle \ \quark_if_no_value:NTF \ \code\rangle \ \code\rangle \ \quark_if_no_value:NTF \ \code\rangle \ \code\rangle \ \quark_if_no_value:NTF \ \quar
```

\quark\_if\_no\_value:cTF

Tests if the  $\langle token \ list \rangle$  contains only  $\q_no\_value$  (distinct from  $\langle token \ list \rangle$  being empty or containing  $\q_no\_value$  plus one or more other tokens).

#### 4 Recursion

This module provides a uniform interface to intercepting and terminating loops as when one is doing tail recursion. The building blocks follow below and an example is shown in Section 5.

\q\_recursion\_tail

This quark is appended to the data structure in question and appears as a real element there. This means it gets any list separators around it.

\q\_recursion\_stop

This quark is added *after* the data structure. Its purpose is to make it possible to terminate the recursion at any point easily.

 $\verb|\quark_if_recursion_tail_stop:N | quark_if_recursion_tail_stop:N | token | |$ 

Tests if  $\langle token \rangle$  contains only the marker  $\q_recursion_tail$ , and if so terminates the recursion this is part of using  $\use_none_delimit_by_q_recursion_stop:w$ . The recursion input must include the marker tokens  $\q_recursion_tail$  and  $\q_recursion_stop$  as the last two items.

 $\label{eq:continuous} $$\operatorname{\operatorname{den}_{tail\_stop:n}} \to \operatorname{\operatorname{den}_{tail\_stop:n}} $$\operatorname{\operatorname{den}_{tail\_stop:n}} \to \operatorname{\operatorname{den}_{tail\_stop:n}} $$\operatorname{\operatorname{den}_{tail\_stop:n}} \to \operatorname{\operatorname{den}_{tail\_stop:n}} $$$ 

Tests if the  $\langle token \ list \rangle$  contains only  $\q_recursion\_tail$ , and if so terminates the recursion this is part of using  $\q_recursion\_delimit\_by\_q\_recursion\_stop:w$ . The recursion input must include the marker tokens  $\q_recursion\_tail$  and  $\q_recursion\_stop$  as the last two items.

\quark\_if\_recursion\_tail\_stop\_do:Nn \quark\_if\_recursion\_tail\_stop\_do:Nn \taken \{\( (insertion \) \} \)

Tests if  $\langle token \rangle$  contains only the marker  $\q_recursion_tail$ , and if so terminates the recursion this is part of using  $\use_none_delimit_by_q_recursion_stop:w$ . The recursion input must include the marker tokens  $\q_recursion_tail$  and  $\q_recursion_stop$  as the last two items. The  $\langle insertion \rangle$  code is then added to the input stream after the recursion has ended.

 $\label{list} $$ \displaystyle \frac{\displaystyle \operatorname{do:nn} \ \operatorname{do:nn}$ 

Tests if the  $\langle token \ list \rangle$  contains only  $\q_recursion\_tail$ , and if so terminates the recursion this is part of using  $\use_none\_delimit\_by\_q\_recursion\_stop:w$ . The recursion input must include the marker tokens  $\q_recursion\_tail$  and  $\q_recursion\_stop$  as the last two items. The  $\langle insertion \rangle$  code is then added to the input stream after the recursion has ended.

#### 5 An example of recursion with quarks

Quarks are mainly used internally in the expl3 code to define recursion functions such as  $\tl_map_inline:nn$  and so on. Here is a small example to demonstrate how to use quarks in this fashion. We shall define a command called  $\mbox{map_dbl:nn}$  which takes a token list and applies an operation to every pair of tokens. For example,  $\mbox{my_map_dbl:nn {abcd} {[--#1--#2--]^}}$  would produce "[-a-b-] [-c-d-] ". Using quarks to define such functions simplifies their logic and ensures robustness in many cases.

Here's the definition of \my\_map\_dbl:nn. First of all, define the function that will do the processing based on the inline function argument #2. Then initiate the recursion using an internal function. The token list #1 is terminated using \q\_recursion\_tail, with delimiters according to the type of recursion (here a pair of \q\_recursion\_tail), concluding with \q\_recursion\_stop. These quarks are used to mark the end of the token list being operated upon.

```
\cs_new:Npn \my_map_dbl:nn #1#2
{
   \cs_set:Npn \__my_map_dbl_fn:nn ##1 ##2 {#2}
   \_my_map_dbl:nn #1 \q_recursion_tail \q_recursion_tail
   \q_recursion_stop
}
```

The definition of the internal recursion function follows. First check if either of the input tokens are the termination quarks. Then, if not, apply the inline function to the two arguments.

```
\cs_new:Nn \__my_map_dbl:nn
{
   \quark_if_recursion_tail_stop:n {#1}
   \quark_if_recursion_tail_stop:n {#2}
   \__my_map_dbl_fn:nn {#1} {#2}

Finally, recurse:
   \__my_map_dbl:nn
}
```

Note that contrarily to IATEX3 built-in mapping functions, this mapping function cannot be nested, since the second map will overwrite the definition of \\_\_my\_map\_dbl\_fn:nn.

# 6 Internal quark functions

```
\label{lem:linear} $$ \__{quark_if_recursion_tail_break:NN} $$ \__{quark_if_recursion_tail_break:nN} $$ \__{quark_if_recursion_tail_break:nN} $$ \cline{tail_break:nN} $$
```

Tests if  $\langle token \ list \rangle$  contains only \q\_recursion\_tail, and if so terminates the recursion using \\\(type\)\_map\_break:. The recursion end should be marked by \prg\_break\_-point:\Nn \\\\\(type\)\_map\_break:.

#### 7 Scan marks

Scan marks are control sequences set equal to \scan\_stop:, hence will never expand in an expansion context and will be (largely) invisible if they are encountered in a typesetting context.

Like quarks, they can be used as delimiters in weird functions and are often safer to use for this purpose. Since they are harmless when executed by TEX in non-expandable contexts, they can be used to mark the end of a set of instructions. This allows to skip to that point if the end of the instructions should not be performed (see |3regex).

The scan marks system is only for internal use by the kernel team in a small number of very specific places. These functions should not be used more generally.

 $\sum_{scan_new:N}$ 

\\_\_scan\_new:N \( scan mark \)

Creates a new  $\langle scan \ mark \rangle$  which is set equal to  $\scan\_stop$ :. The  $\langle scan \ mark \rangle$  will be defined globally, and an error message will be raised if the name was already taken by another scan mark.

\s\_\_stop

Used at the end of a set of instructions, as a marker that can be jumped to using \\_\_-use\_none\_delimit\_by\_s\_\_stop:w.

\\_\_use\_none\_delimit\_by\_s\_\_stop:w \\_\_use\_none\_delimit\_by\_s\_\_stop:w  $\langle tokens 
angle$  \s\_\_stop

Removes the  $\langle tokens \rangle$  and  $\S_stop$  from the input stream. This leads to a low-level TeX error if  $\S_stop$  is absent.

#### Part VIII

# The l3token package Token manipulation

This module deals with tokens. Now this is perhaps not the most precise description so let's try with a better description: When programming in TeX, it is often desirable to know just what a certain token is: is it a control sequence or something else. Similarly one often needs to know if a control sequence is expandable or not, a macro or a primitive, how many arguments it takes etc. Another thing of great importance (especially when it comes to document commands) is looking ahead in the token stream to see if a certain character is present and maybe even remove it or disregard other tokens while scanning. This module provides functions for both and as such will have two primary function categories: \token\_ for anything that deals with tokens and \peek\_ for looking ahead in the token stream.

Most of the time we will be using the term "token" but most of the time the function we're describing can equally well by used on a control sequence as such one is one token as well.

#### 1 All possible tokens

Let us start by reviewing every case that a given token can fall into. It is very important to distinguish two aspects of a token: its meaning, and what it looks like.

For instance,  $\if:w$ ,  $\if:charcode:w$ , and  $\tex_if:D$  are three names for the same internal operation of TEX, namely the primitive testing the next two characters for equality of their character code. They behave identically in many situations. However, TEX distinguishes them when searching for a delimited argument. Namely, the example function  $\show_until_if:w$  defined below will take everything until  $\show_intil_if:w$  as an argument, despite the presence of other copies of  $\show_intil_if:w$  under different names.

```
\cs_new:Npn \show_until_if:w #1 \if:w { \tl_show:n {#1} }
\show_until_if:w \tex_if:D \if_charcode:w \if:w
```

# 2 Creating character tokens

\char\_set\_active\_eq:NN
\char\_set\_active\_eq:Nc
\char\_gset\_active\_eq:Nc
\char\_gset\_active\_eq:Nc

Updated: 2015-11-12

 $\char_set_active_eq:NN \ \langle char \rangle \ \langle function \rangle$ 

Sets the behaviour of the  $\langle char \rangle$  in situations where it is active (category code 13) to be equivalent to that of the  $\langle function \rangle$ . The category code of the  $\langle char \rangle$  is unchanged by this process. The  $\langle function \rangle$  may itself be an active character.

\char\_set\_active\_eq:nN \char\_set\_active\_eq:nN \( \char\_set\_active\_eq:nN \) \( \char\_set\_active\_eq:nN \)

Sets the behaviour of the  $\langle char \rangle$  which has character code as given by the  $\langle integer\ expression \rangle$  in situations where it is active (category code 13) to be equivalent to that of the  $\langle function \rangle$ . The category code of the  $\langle char \rangle$  is unchanged by this process. The  $\langle function \rangle$  may itself be an active character.

\char\_generate:nn \*

New: 2015-09-09

Generates a character token of the given  $\langle charcode \rangle$  and  $\langle catcode \rangle$  (both of which may be integer expressions). The  $\langle catcode \rangle$  may be one of

- 1 (begin group)
- 2 (end group)
- 3 (math toggle)
- 4 (alignment)
- 6 (parameter)
- 7 (math superscript)
- 8 (math subscript)
- 11 (letter)
- 12 (other)

and other values will raise an error.

The  $\langle charcode \rangle$  may be any one valid for the engine in use. Note however that for X<sub>H</sub>T<sub>E</sub>X releases prior to 0.99992 only the 8-bit range (0 to 255) is accepted due to engine limitations.

#### 3 Manipulating and interrogating character tokens

```
\char_set_catcode_escape:N
                                       \char_set_catcode_letter:N \( character \)
\char_set_catcode_group_begin:N
\char_set_catcode_group_end:N
\char_set_catcode_math_toggle:N
\char_set_catcode_alignment:N
\char_set_catcode_end_line:N
\char_set_catcode_parameter:N
\char_set_catcode_math_superscript:N
\char_set_catcode_math_subscript:N
\char_set_catcode_ignore:N
\char_set_catcode_space:N
\char_set_catcode_letter:N
\char_set_catcode_other:N
\char_set_catcode_active:N
\char_set_catcode_comment:N
\char_set_catcode_invalid:N
```

Updated: 2015-11-11

Sets the category code of the  $\langle character \rangle$  to that indicated in the function name. Depending on the current category code of the  $\langle token \rangle$  the escape token may also be needed:

```
\char_set_catcode_other:N \%
```

The assignment is local.

```
\char_set_catcode_escape:n
                                        \char_set_catcode_letter:n {\langle integer expression \rangle}
\char_set_catcode_group_begin:n
\char_set_catcode_group_end:n
\char_set_catcode_math_toggle:n
\char_set_catcode_alignment:n
\char_set_catcode_end_line:n
\char_set_catcode_parameter:n
\char_set_catcode_math_superscript:n
\char_set_catcode_math_subscript:n
\char_set_catcode_ignore:n
\char_set_catcode_space:n
\char_set_catcode_letter:n
\char_set_catcode_other:n
\char_set_catcode_active:n
\char_set_catcode_comment:n
\char_set_catcode_invalid:n
```

Updated: 2015-11-11

Sets the category code of the  $\langle character \rangle$  which has character code as given by the  $\langle integer\ expression \rangle$ . This version can be used to set up characters which cannot otherwise be given (cf. the N-type variants). The assignment is local.

\char\_set\_catcode:nn

Updated: 2015-11-11

These functions set the category code of the  $\langle character \rangle$  which has character code as given by the  $\langle integer\ expression \rangle$ . The first  $\langle integer\ expression \rangle$  is the character code and the second is the category code to apply. The setting applies within the current TEX group. In general, the symbolic functions  $\char_set_catcode_\langle type\rangle$  should be preferred, but there are cases where these lower-level functions may be useful.

\char\_value\_catcode:n \*

\char\_value\_catcode:n {\langle integer expression \rangle}

Expands to the current category code of the  $\langle character \rangle$  with character code given by the  $\langle integer\ expression \rangle$ .

\char\_show\_value\_catcode:n

\char\_show\_value\_catcode:n {\( integer expression \) \}

Displays the current category code of the  $\langle character \rangle$  with character code given by the  $\langle integer\ expression \rangle$  on the terminal.

\char\_set\_lccode:nn

Updated: 2015-08-06

Sets up the behaviour of the  $\langle character \rangle$  when found inside  $\t1_to_lowercase:n$ , such that  $\langle character_1 \rangle$  will be converted into  $\langle character_2 \rangle$ . The two  $\langle characters \rangle$  may be specified using an  $\langle integer\ expression \rangle$  for the character code concerned. This may include the  $T_{EX}$  ' $\langle character \rangle$  method for converting a single character into its character code:

```
\char_set_lccode:nn { '\A } { '\a } % Standard behaviour
\char_set_lccode:nn { '\A } { '\A + 32 }
\char_set_lccode:nn { 50 } { 60 }
```

The setting applies within the current T<sub>E</sub>X group.

\char\_value\_lccode:n \*

\char\_value\_lccode:n {\langle integer expression \rangle}

Expands to the current lower case code of the  $\langle character \rangle$  with character code given by the  $\langle integer\ expression \rangle$ .

\char\_show\_value\_lccode:n

\char\_show\_value\_lccode:n {\langle integer expression \rangle}

Displays the current lower case code of the  $\langle character \rangle$  with character code given by the  $\langle integer\ expression \rangle$  on the terminal.

\char\_set\_uccode:nn

Updated: 2015-08-06

Sets up the behaviour of the  $\langle character \rangle$  when found inside  $\t1_to\_uppercase:n$ , such that  $\langle character_1 \rangle$  will be converted into  $\langle character_2 \rangle$ . The two  $\langle characters \rangle$  may be specified using an  $\langle integer\ expression \rangle$  for the character code concerned. This may include the  $T_{FX}$  ' $\langle character \rangle$  method for converting a single character into its character code:

```
\char_set_uccode:nn { '\a } { '\A } % Standard behaviour
\char_set_uccode:nn { '\A } { '\A - 32 }
\char_set_uccode:nn { 60 } { 50 }
```

The setting applies within the current  $T_{EX}$  group.

\char\_value\_uccode:n \*

\char\_value\_uccode:n {\langle integer expression \rangle}

Expands to the current upper case code of the  $\langle character \rangle$  with character code given by the  $\langle integer\ expression \rangle$ .

\char\_show\_value\_uccode:n

 $\verb|\char_show_value_uccode:n {| (integer expression)|}|$ 

Displays the current upper case code of the  $\langle character \rangle$  with character code given by the  $\langle integer\ expression \rangle$  on the terminal.

\char\_set\_mathcode:nn

 $\color= \{\langle intexpr_1 \rangle\} \ \{\langle intexpr_2 \rangle\}$ 

Updated: 2015-08-06

This function sets up the math code of  $\langle character \rangle$ . The  $\langle character \rangle$  is specified as an  $\langle integer\ expression \rangle$  which will be used as the character code of the relevant character. The setting applies within the current T<sub>E</sub>X group.

\char\_value\_mathcode:n

 $\verb|\char_value_mathcode:n {| (integer expression)|}|$ 

Expands to the current math code of the  $\langle character \rangle$  with character code given by the  $\langle integer\ expression \rangle$ .

\char\_show\_value\_mathcode:n

\char\_show\_value\_mathcode:n {\langle integer expression \rangle}

Displays the current math code of the  $\langle character \rangle$  with character code given by the  $\langle integer\ expression \rangle$  on the terminal.

\char\_set\_sfcode:nn

Updated: 2015-08-06

This function sets up the space factor for the  $\langle character \rangle$ . The  $\langle character \rangle$  is specified as an  $\langle integer\ expression \rangle$  which will be used as the character code of the relevant character. The setting applies within the current TEX group.

\char\_value\_sfcode:n \*

\char\_value\_sfcode:n {\langle integer expression \rangle}

Expands to the current space factor for the  $\langle character \rangle$  with character code given by the  $\langle integer\ expression \rangle$ .

\char\_show\_value\_sfcode:n

\char\_show\_value\_sfcode:n {\langle integer expression \rangle}

Displays the current space factor for the  $\langle character \rangle$  with character code given by the  $\langle integer\ expression \rangle$  on the terminal.

\l\_char\_active\_seq

New: 2012-01-23 Updated: 2015-11-11 Used to track which tokens may require special handling at the document level as they are (or have been at some point) of category  $\langle active \rangle$  (catcode 13). Each entry in the sequence consists of a single escaped token, for example  $\$ . Active tokens should be added to the sequence when they are defined for general document use.

\l\_char\_special\_seq

New: 2012-01-23 Updated: 2015-11-11 Used to track which tokens will require special handling when working with verbatim-like material at the document level as they are not of categories  $\langle letter \rangle$  (catcode 11) or  $\langle other \rangle$  (catcode 12). Each entry in the sequence consists of a single escaped token, for example  $\backslash \$  for the backslash or  $\backslash \$  for an opening brace. Escaped tokens should be added to the sequence when they are defined for general document use.

#### 4 Generic tokens

\token\_new:Nn

 $\token_new:Nn \langle token_1 \rangle \{\langle token_2 \rangle\}$ 

Defines  $\langle token_1 \rangle$  to globally be a snapshot of  $\langle token_2 \rangle$ . This will be an implicit representation of  $\langle token_2 \rangle$ .

\c\_group\_begin\_token
\c\_group\_end\_token
\c\_math\_toggle\_token
\c\_alignment\_token
\c\_parameter\_token
\c\_math\_superscript\_token
\c\_math\_subscript\_token
\c\_space\_token

These are implicit tokens which have the category code described by their name. They are used internally for test purposes but are also available to the programmer for other uses.

\c\_catcode\_letter\_token \c\_catcode\_other\_token

These are implicit tokens which have the category code described by their name. They are used internally for test purposes and should not be used other than for category code tests.

\c\_catcode\_active\_tl

A token list containing an active token. This is used internally for test purposes and should not be used other than in appropriately-constructed category code tests.

#### 5 Converting tokens

```
\t \token_to_meaning:N \star
```

```
\token_to_meaning:N \langle token \rangle
```

\token\_to\_meaning:c

Inserts the current meaning of the  $\langle token \rangle$  into the input stream as a series of characters of category code 12 (other). This will be the primitive TEX description of the  $\langle token \rangle$ , thus for example both functions defined by \cs\_set\_nopar:Npn and token list variables defined using \t1\_new:N will be described as macros.

TEXhackers note: This is the TEX primitive \meaning.

\token\_to\_str:N \*
\token\_to\_str:c \*

```
\token_to_str:N \langle token \rangle
```

Converts the given  $\langle token \rangle$  into a series of characters with category code 12 (other). The current escape character will be the first character in the sequence, although this will also have category code 12 (the escape character is part of the  $\langle token \rangle$ ). This function requires only a single expansion.

TEXhackers note: \token\_to\_str:N is the TEX primitive \string renamed.

#### 6 Token conditionals

Tests if  $\langle token \rangle$  has the category code of a begin group token ( $\{$  when normal TEX category codes are in force). Note that an explicit begin group token cannot be tested in this way, as it is not a valid N-type argument.

\token\_if\_group\_end\_p:N \*
\token\_if\_group\_end:NTF \*

Tests if  $\langle token \rangle$  has the category code of an end group token (} when normal TEX category codes are in force). Note that an explicit end group token cannot be tested in this way, as it is not a valid N-type argument.

```
\label{token_if_math_toggle_p:N token_if_math_toggle_p:N (token) } $$ \token_if_math_toggle:NTF $$ \t
```

Tests if  $\langle token \rangle$  has the category code of a math shift token (\$ when normal TEX category codes are in force).

```
\token_if_alignment_p:N >
\token_if_alignment:N<u>TF</u> >
```

```
\label{token_if_alignment_p:N $$ $$ \code} $$ \code_{\code} {\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_{\code_\code_\code_{\code_{\code_}\code_{\code_{\code_{\code_\code_\code_\code_}\code_{\code_{\code_}
```

Tests if  $\langle token \rangle$  has the category code of an alignment token (& when normal TEX category codes are in force).

```
\token_if_parameter_p:N \langle token \rangle
\token_if_parameter_p:N *
                                                                    \verb|\token_if_alignment:NTF| $$ \langle token \rangle $ \{ \langle true \ code \rangle \} $$ \{ \langle false \ code \rangle \} $$
\token_if_parameter:NTF
                                                                    Tests if \langle token \rangle has the category code of a macro parameter token (# when normal T<sub>F</sub>X
                                                                    category codes are in force).
                                                                                                  \token_if_math_superscript_p:N \langle token \rangle
             \token_if_math_superscript_p:N *

#### 7 Peeking ahead at the next token

There is often a need to look ahead at the next token in the input stream while leaving it in place. This is handled using the "peek" functions. The generic \peek\_after:Nw is provided along with a family of predefined tests for common cases. As peeking ahead does not skip spaces the predefined tests include both a space-respecting and space-skipping version.

\peek\_after:Nw

\peek\_after:Nw \( function \) \( \taken \)

Locally sets the test variable  $\locall$ \_peek\_token equal to  $\langle token \rangle$  (as an implicit token, not as a token list), and then expands the  $\langle function \rangle$ . The  $\langle token \rangle$  will remain in the input stream as the next item after the  $\langle function \rangle$ . The  $\langle token \rangle$  here may be  $_{\sqcup}$ , { or } (assuming normal TEX category codes), i.e. it is not necessarily the next argument which would be grabbed by a normal function.

\peek\_gafter:Nw

\peek\_gafter:Nw \( function \) \( \taken \)

Globally sets the test variable  $\g_peek\_token$  equal to  $\langle token \rangle$  (as an implicit token, not as a token list), and then expands the  $\langle function \rangle$ . The  $\langle token \rangle$  will remain in the input stream as the next item after the  $\langle function \rangle$ . The  $\langle token \rangle$  here may be  $\Box$ , { or } (assuming normal TeX category codes), i.e. it is not necessarily the next argument which would be grabbed by a normal function.

\l\_peek\_token

Token set by \peek\_after: Nw and available for testing as described above.

\g\_peek\_token

Token set by \peek\_gafter: Nw and available for testing as described above.

\peek\_catcode:NTF

 $\perbox{peek\_catcode:NTF } \langle test token \rangle \ \{\langle true code \rangle\} \ \{\langle false code \rangle\}$ 

Updated: 2012-12-20

Tests if the next  $\langle token \rangle$  in the input stream has the same category code as the  $\langle test \ token \rangle$  (as defined by the test \token\_if\_eq\_catcode:NNTF). Spaces are respected by the test and the  $\langle token \rangle$  will be left in the input stream after the  $\langle true \ code \rangle$  or  $\langle false \ code \rangle$  (as appropriate to the result of the test).

```
\frac{\texttt{\peek\_catcode\_ignore\_spaces:NTF}}{\texttt{\peek\_catcode\_ignore\_spaces:NTF}} \ \ \langle \textit{test token} \rangle \ \{\langle \textit{true code} \rangle\} \ \ \langle \textit{tode} \rangle\} \ \ \langle \textit{tode} \rangle\}
```

Tests if the next non-space  $\langle token \rangle$  in the input stream has the same category code as the  $\langle test\ token \rangle$  (as defined by the test \token\_if\_eq\_catcode:NNTF). Explicit and implicit space tokens (with character code 32 and category code 10) are ignored and removed by the test and the  $\langle token \rangle$  will be left in the input stream after the  $\langle true\ code \rangle$  or  $\langle false\ code \rangle$  (as appropriate to the result of the test).

\peek\_catcode\_remove:NTF

 $\perbox{$\operatorname{\text{peek\_catcode\_remove:NTF}}$ $$ \langle \operatorname{test\ token} \rangle $$ {\langle \operatorname{true\ code} \rangle } $$ {\langle \operatorname{false\ code} \rangle }$ }$ 

Updated: 2012-12-20

Tests if the next  $\langle token \rangle$  in the input stream has the same category code as the  $\langle token \rangle$  (as defined by the test  $\token_if_eq_catcode:NNTF$ ). Spaces are respected by the test and the  $\langle token \rangle$  will be removed from the input stream if the test is true. The function will then place either the  $\langle true\ code \rangle$  or  $\langle false\ code \rangle$  in the input stream (as appropriate to the result of the test).

Updated: 2011-07-02

Tests if the next  $\langle token \rangle$  in the input stream has the same meaning as the  $\langle test\ token \rangle$  (as defined by the test \token\_if\_eq\_meaning:NNTF). Spaces are respected by the test and the  $\langle token \rangle$  will be left in the input stream after the  $\langle true\ code \rangle$  or  $\langle false\ code \rangle$  (as appropriate to the result of the test).

Tests if the next non-space  $\langle token \rangle$  in the input stream has the same meaning as the  $\langle test\ token \rangle$  (as defined by the test \token\_if\_eq\_meaning:NNTF). Explicit and implicit space tokens (with character code 32 and category code 10) are ignored and removed by the test and the  $\langle token \rangle$  will be left in the input stream after the  $\langle true\ code \rangle$  or  $\langle false\ code \rangle$  (as appropriate to the result of the test).

\peek\_meaning\_remove:NTF

 $\peek_meaning_remove:NTF \langle test token \rangle \{\langle true code \rangle\} \{\langle false code \rangle\}$ 

Updated: 2011-07-02

Tests if the next  $\langle token \rangle$  in the input stream has the same meaning as the  $\langle test\ token \rangle$  (as defined by the test \token\_if\_eq\_meaning:NNTF). Spaces are respected by the test and the  $\langle token \rangle$  will be removed from the input stream if the test is true. The function will then place either the  $\langle true\ code \rangle$  or  $\langle false\ code \rangle$  in the input stream (as appropriate to the result of the test).

Tests if the next non-space  $\langle token \rangle$  in the input stream has the same meaning as the  $\langle test\ token \rangle$  (as defined by the test \token\_if\_eq\_meaning:NNTF). Explicit and implicit space tokens (with character code 32 and category code 10) are ignored and removed by the test and the  $\langle token \rangle$  will be removed from the input stream if the test is true. The function will then place either the  $\langle true\ code \rangle$  or  $\langle false\ code \rangle$  in the input stream (as appropriate to the result of the test).

#### 8 Decomposing a macro definition

These functions decompose  $T_EX$  macros into their constituent parts: if the  $\langle token \rangle$  passed is not a macro then no decomposition can occur. In the later case, all three functions leave \scan\_stop: in the input stream.

\token\_get\_arg\_spec:N \*

```
\token_get_arg_spec:N \langle token \rangle
```

If the  $\langle token \rangle$  is a macro, this function will leave the primitive  $T_EX$  argument specification in input stream as a string of tokens of category code 12 (with spaces having category code 10). Thus for example for a token \next defined by

```
\cs_set:Npn \next #1#2 { x #1 y #2 }
```

will leave #1#2 in the input stream. If the  $\langle token \rangle$  is not a macro then \scan\_stop: will be left in the input stream.

**TeXhackers note:** If the arg spec. contains the string ->, then the **spec** function will produce incorrect results.

```
\token_get_replacement_spec:N * \token_get_replacement_spec:N \( \token \)
```

If the  $\langle token \rangle$  is a macro, this function will leave the replacement text in input stream as a string of tokens of category code 12 (with spaces having category code 10). Thus for example for a token  $\nexto$  defined by

```
\cs_set:Npn \next #1#2 { x #1~y #2 }
```

will leave x#1 y#2 in the input stream. If the  $\langle token \rangle$  is not a macro then \scan\_stop: will be left in the input stream.

 $T_EX$  hackers note: If the arg spec. contains the string  $\rightarrow$ , then the spec function will produce incorrect results.

\token\_get\_prefix\_spec:N \*

```
\token_get_prefix_spec:N \langle token \rangle
```

If the  $\langle token \rangle$  is a macro, this function will leave the TEX prefixes applicable in input stream as a string of tokens of category code 12 (with spaces having category code 10). Thus for example for a token \next defined by

```
\cs_set:Npn \next #1#2 { x #1~y #2 }
```

will leave \long in the input stream. If the  $\langle token \rangle$  is not a macro then \scan\_stop: will be left in the input stream

# 9 Internal functions

\\_\_char\_generate:nn \*

 $\cline{char_generate:nn {\langle charcode \rangle} {\langle catcode \rangle}}$ 

New: 2016-03-25

This function is identical in operation to the public \char\_generate:nn but omits various sanity tests. In particular, this means it is used in certain places where engine variations need to be accounted for by the kernel.

#### Part IX

# The l3int package Integers

Calculation and comparison of integer values can be carried out using literal numbers, int registers, constants and integers stored in token list variables. The standard operators +, -, / and \* and parentheses can be used within such expressions to carry arithmetic operations. This module carries out these functions on *integer expressions* ("intexpr").

#### 1 Integer expressions

\int\_eval:n \*

```
\int_eval:n {\(\langle\) integer expression\\\}
```

Evaluates the  $\langle integer\ expression \rangle$ , expanding any integer and token list variables within the  $\langle expression \rangle$  to their content (without requiring \int\_use:N/\tl\_use:N) and applying the standard mathematical rules. For example both

```
\int_eval:n { 5 + 4 * 3 - ( 3 + 4 * 5 ) }
and

\tl_new:N \l_my_tl
\tl_set:Nn \l_my_tl { 5 }
\int_new:N \l_my_int
\int_set:Nn \l_my_int { 4 }
\int_eval:n { \l_my_tl + \l_my_int * 3 - ( 3 + 4 * 5 ) }
```

both evaluate to -6. The  $\{\langle integer\ expression \rangle\}$  may contain the operators +, -, \* and /, along with parenthesis ( and ). Any functions within the expressions should expand to an  $\langle integer\ denotation \rangle$ : a sequence of a sign and digits matching the regex  $\-?[0-9]+$ ). After expansion  $\int_eval:n$  yields an  $\langle integer\ denotation \rangle$  which is left in the input stream.

**TEXhackers note:** Exactly two expansions are needed to evaluate  $\int_eval:n$ . The result is *not* an  $\langle internal\ integer \rangle$ , and therefore requires suitable termination if used in a TEX-style integer assignment.

\int\_abs:n \*

```
\int \int \int ds \cdot ds = \int \int ds = \int
```

Updated: 2012-09-26

Evaluates the  $\langle integer\ expression \rangle$  as described for  $\int_eval:n$  and leaves the absolute value of the result in the input stream as an  $\langle integer\ denotation \rangle$  after two expansions.

 $\int_div_round:nn +$ 

 $\left\langle int_div_round:nn \left\{ \left\langle intexpr_1 \right\rangle \right\} \left\{ \left\langle intexpr_2 \right\rangle \right\}$ 

Updated: 2012-09-26

Evaluates the two (integer expressions) as described earlier, then divides the first value by the second, and rounds the result to the closest integer. Ties are rounded away from zero. Note that this is identical to using / directly in an (integer expression). The result is left in the input stream as an (integer denotation) after two expansions.

\int\_div\_truncate:nn \*

 $\int \int div_{truncate:nn} \{\langle intexpr_1 \rangle\} \{\langle intexpr_2 \rangle\}$ 

Updated: 2012-02-09

Evaluates the two (integer expressions) as described earlier, then divides the first value by the second, and rounds the result towards zero. Note that division using / rounds to the closest integer instead. The result is left in the input stream as an (integer denotation) after two expansions.

```
\int_max:nn
\int_min:nn
```

 $\int \int max:nn \{\langle intexpr_1 \rangle\} \{\langle intexpr_2 \rangle\}$  $\int \inf_{\min:nn} \{\langle intexpr_1 \rangle\} \{\langle intexpr_2 \rangle\}$ 

Updated: 2012-09-26

Evaluates the (integer expressions) as described for \int\_eval:n and leaves either the larger or smaller value in the input stream as an  $\langle integer\ denotation \rangle$  after two expansions.

\int\_mod:nn

 $\int \inf_{mod:nn} \{\langle intexpr_1 \rangle\} \{\langle intexpr_2 \rangle\}$ 

Updated: 2012-09-26

Evaluates the two (integer expressions) as described earlier, then calculates the integer remainder of dividing the first expression by the second. This is obtained by subtract-Thus, the result has the same sign as  $\langle intexpr_1 \rangle$  and its absolute value is strictly less than that of  $\langle intexpr_2 \rangle$ . The result is left in the input stream as an  $\langle integer\ denotation \rangle$  after two expansions.

# Creating and initialising integers

\int\_new:N \int\_new:c \int\_new:N \( \) integer \( \)

Creates a new (integer) or raises an error if the name is already taken. The declaration

is global. The  $\langle integer \rangle$  will initially be equal to 0.

\int\_const:Nn \int\_const:cn \int\_const:Nn \( \) integer \( \) \( \) \( \) integer \( \) expression \( \) \( \)

Updated: 2011-10-22

Creates a new constant  $\langle integer \rangle$  or raises an error if the name is already taken. The value of the  $\langle integer \rangle$  will be set globally to the  $\langle integer \ expression \rangle$ .

\int\_zero:N \int\_zero:c \int\_gzero:N \int\_gzero:c \int\_zero:N \(\langle integer\rangle \)

Sets  $\langle integer \rangle$  to 0.

\int\_zero\_new:N \int\_zero\_new:N \( \) integer \( \) \int\_zero\_new:c Ensures that the \(\langle integer\rangle\) exists globally by applying \\int\_new:N if necessary, then \int\_gzero\_new:N applies  $\inf_{g}$  set to zero. \int\_gzero\_new:c New: 2011-12-13 \int\_set\_eq:NN \int\_set\_eq:(cN|Nc|cc) Sets the content of  $\langle integer_1 \rangle$  equal to that of  $\langle integer_2 \rangle$ . \int\_gset\_eq:NN \int\_if\_exist\_p:N \* \int\_if\_exist\_p:c \* Tests whether the  $\langle int \rangle$  is currently defined. This does not check that the  $\langle int \rangle$  really is \int\_if\_exist:cTF \* an integer variable. New: 2012-03-03

## 3 Setting and incrementing integers

\int\_add:Nn \int\_add:Nn \( \)integer \( \) \( \) \( \) \( \)integer \( \) \( \) \int\_add:cn Adds the result of the  $\langle integer\ expression \rangle$  to the current content of the  $\langle integer \rangle$ . \int\_gadd:Nn \int\_gadd:cn Updated: 2011-10-22 \int\_decr:N \int\_decr:N \( \) integer \( \) \int\_decr:c Decreases the value stored in  $\langle integer \rangle$  by 1. \int\_gdecr:N \int\_gdecr:c \int\_incr:N \int\_incr:N \( \) integer \( \) \int\_incr:c Increases the value stored in  $\langle integer \rangle$  by 1. \int\_gincr:N \int\_gincr:c \int\_set:Nn \( \) integer \( \) \( \) \( \) integer \( \) expression \( \) \( \) \int\_set:Nn \int\_set:cn Sets  $\langle integer \rangle$  to the value of  $\langle integer\ expression \rangle$ , which must evaluate to an integer (as \int\_gset:Nn described for \int\_eval:n). \int\_gset:cn Updated: 2011-10-22

\int\_sub:Nn
\int\_sub:cn
\int\_gsub:Nn
\int\_gsub:cn

Updated: 2011-10-22

\int\_sub:Nn \(\langle integer \rangle \langle \langle integer expression \rangle \rangle \)

Subtracts the result of the  $\langle integer\ expression \rangle$  from the current content of the  $\langle integer \rangle$ .

# 4 Using integers

\int\_use:N 
\int\_use:c 
\*

\int\_use:N \( \)integer \( \)

Updated: 2011-10-22

Recovers the content of an  $\langle integer \rangle$  and places it directly in the input stream. An error will be raised if the variable does not exist or if it is invalid. Can be omitted in places where an  $\langle integer \rangle$  is required (such as in the first and third arguments of  $\int_compare:nNnTF$ ).

TeXhackers note: \int\_use:N is the TeX primitive \the: this is one of several LATeX3 names for this primitive.

# 5 Integer expression conditionals

\int\_compare\_p:nNn \int\_compare:nNnTF

This function first evaluates each of the  $\langle integer\ expressions \rangle$  as described for  $\int_-eval:n$ . The two results are then compared using the  $\langle relation \rangle$ :

Equal Greater than Less than

 $\{\langle true\ code \rangle\}\ \{\langle false\ code \rangle\}$ 

This function evaluates the  $\langle integer\ expressions \rangle$  as described for  $\int_{eval:n}\ and\ compares\ consecutive\ result\ using the\ corresponding\ \langle relation \rangle$ , namely it compares  $\langle intexpr_1 \rangle$  and  $\langle intexpr_2 \rangle$  using the  $\langle relation_1 \rangle$ , then  $\langle intexpr_2 \rangle$  and  $\langle intexpr_3 \rangle$  using the  $\langle relation_2 \rangle$ , until finally comparing  $\langle intexpr_N \rangle$  and  $\langle intexpr_{N+1} \rangle$  using the  $\langle relation_N \rangle$ . The test yields true if all comparisons are true. Each  $\langle integer\ expression \rangle$  is evaluated only once, and the evaluation is lazy, in the sense that if one comparison is false, then no other  $\langle integer\ expression \rangle$  is evaluated and no other comparison is performed. The  $\langle relations \rangle$  can be any of the following:

```
Equal = or ==
Greater than or equal to >=
Greater than >=
Correct than >=
Corr
```

```
\int_case:nn<u>TF</u> *
New: 2013-07-24
```

```
\label{eq:case:nnTF} $$ \{ \text{test integer expression} \} $$ $$ {$ \{ (\text{intexpr } case_1) \} \ \{ (\text{code } case_1) \} \ \{ (\text{intexpr } case_2) \} \ \dots \ \{ (\text{intexpr } case_n) \} \ \{ (\text{code } case_n) \} \} $$ $$ { \{ \text{true } code \} \} $$ $$ { \{ \text{false } code \} \} $$} $$
```

This function evaluates the  $\langle test\ integer\ expression \rangle$  and compares this in turn to each of the  $\langle integer\ expression\ cases \rangle$ . If the two are equal then the associated  $\langle code \rangle$  is left in the input stream. If any of the cases are matched, the  $\langle true\ code \rangle$  is also inserted into the input stream (after the code for the appropriate case), while if none match then the  $\langle false\ code \rangle$  is inserted. The function  $\ int_case:nn$ , which does nothing if there is no match, is also available. For example

will leave "Medium" in the input stream.

```
\int_if_even_p:n *
\int_if_even:nTF *
\int_if_odd_p:n *
\int_if_odd:nTF *
```

```
\label{lem:linear_codd_p:n {(integer expression)}} $$ \left\{ \inf_{odd:nTF \{(integer expression)\} \} } \left\{ \left\langle true \ code \right\rangle \right\} $$ \left\{ \left\langle false \ code \right\rangle \right\} $$
```

This function first evaluates the  $\langle integer\ expression \rangle$  as described for  $\int_eval:n$ . It then evaluates if this is odd or even, as appropriate.

# 6 Integer expression loops

\int\_do\_until:nNnn ☆

```
\label{linear_dountil:nNnn} $$ \left( intexpr_1 \right) \right. \left. \left( code \right) \right. $$ \left( code \right) \right. $$
```

Places the  $\langle code \rangle$  in the input stream for TEX to process, and then evaluates the relationship between the two  $\langle integer\ expressions \rangle$  as described for \int\_compare:nNnTF. If the test is false then the  $\langle code \rangle$  will be inserted into the input stream again and a loop will occur until the  $\langle relation \rangle$  is true.

\int\_do\_while:nNnn 🌣

 $\int \int do_{while:nNnn} {\langle intexpr_1 \rangle} \langle relation \rangle {\langle intexpr_2 \rangle} {\langle code \rangle}$ 

Places the  $\langle code \rangle$  in the input stream for TEX to process, and then evaluates the relationship between the two  $\langle integer\ expressions \rangle$  as described for \int\_compare:nNnTF. If the test is true then the  $\langle code \rangle$  will be inserted into the input stream again and a loop will occur until the  $\langle relation \rangle$  is false.

\int\_until\_do:nNnn 🌣

 $\int \int \int ds \ln ds = \int \int ds = \int \int ds \ln ds = \int ds = \int \int ds = \int ds = \int \int ds = \int ds =$ 

Evaluates the relationship between the two  $\langle integer\ expressions \rangle$  as described for  $\int_-compare:nNnTF$ , and then places the  $\langle code \rangle$  in the input stream if the  $\langle relation \rangle$  is false. After the  $\langle code \rangle$  has been processed by  $T_EX$  the test will be repeated, and a loop will occur until the test is true.

\int\_while\_do:nNnn ☆

Evaluates the relationship between the two  $\langle integer\ expressions \rangle$  as described for  $\int_-compare:nNnTF$ , and then places the  $\langle code \rangle$  in the input stream if the  $\langle relation \rangle$  is true. After the  $\langle code \rangle$  has been processed by  $T_EX$  the test will be repeated, and a loop will occur until the test is false.

\int\_do\_until:nn 🌣

 $\int \int dc = \frac{dc}{dc} \{ (integer relation) \}$ 

Updated: 2013-01-13

Places the  $\langle code \rangle$  in the input stream for TEX to process, and then evaluates the  $\langle integer\ relation \rangle$  as described for \int\_compare:nTF. If the test is false then the  $\langle code \rangle$  will be inserted into the input stream again and a loop will occur until the  $\langle relation \rangle$  is true.

\int\_do\_while:nn ☆

Updated: 2013-01-13

Places the  $\langle code \rangle$  in the input stream for TEX to process, and then evaluates the  $\langle integer\ relation \rangle$  as described for \int\_compare:nTF. If the test is true then the  $\langle code \rangle$  will be inserted into the input stream again and a loop will occur until the  $\langle relation \rangle$  is false.

\int\_until\_do:nn 🔯

 $\int \int \int ds \ln ds = \int ds + \int ds = \int ds$ 

Updated: 2013-01-13

Evaluates the  $\langle integer\ relation \rangle$  as described for \int\_compare:nTF, and then places the  $\langle code \rangle$  in the input stream if the  $\langle relation \rangle$  is false. After the  $\langle code \rangle$  has been processed by TFX the test will be repeated, and a loop will occur until the test is true.

\int\_while\_do:nn 🌣

Updated: 2013-01-13

Evaluates the  $\langle integer\ relation \rangle$  as described for \int\_compare:nTF, and then places the  $\langle code \rangle$  in the input stream if the  $\langle relation \rangle$  is true. After the  $\langle code \rangle$  has been processed by T<sub>E</sub>X the test will be repeated, and a loop will occur until the test is false.

#### 7 Integer step functions

\int\_step\_function:nnnN 🌣

New: 2012-06-04 Updated: 2014-05-30 This function first evaluates the  $\langle initial\ value \rangle$ ,  $\langle step \rangle$  and  $\langle final\ value \rangle$ , all of which should be integer expressions. The  $\langle function \rangle$  is then placed in front of each  $\langle value \rangle$  from the  $\langle initial\ value \rangle$  to the  $\langle final\ value \rangle$  in turn (using  $\langle step \rangle$  between each  $\langle value \rangle$ ). The  $\langle step \rangle$  must be non-zero. If the  $\langle step \rangle$  is positive, the loop stops when the  $\langle value \rangle$  becomes larger than the  $\langle final\ value \rangle$ . If the  $\langle step \rangle$  is negative, the loop stops when the  $\langle value \rangle$  becomes smaller than the  $\langle final\ value \rangle$ . The  $\langle function \rangle$  should absorb one numerical argument. For example

```
\cs_{set:Npn \my_func:n \#1 { [I~saw~\#1] \quad } \\ int_{step_function:nnnN { 1 } { 1 } { 5 } \\ my_func:n \\ \cline{thm:line}
```

would print

```
[I \text{ saw } 1] [I \text{ saw } 2] [I \text{ saw } 3] [I \text{ saw } 4] [I \text{ saw } 5]
```

New: 2012-06-04 Updated: 2014-05-30 This function first evaluates the  $\langle initial\ value \rangle$ ,  $\langle step \rangle$  and  $\langle final\ value \rangle$ , all of which should be integer expressions. Then for each  $\langle value \rangle$  from the  $\langle initial\ value \rangle$  to the  $\langle final\ value \rangle$  in turn (using  $\langle step \rangle$  between each  $\langle value \rangle$ ), the  $\langle code \rangle$  is inserted into the input stream with #1 replaced by the current  $\langle value \rangle$ . Thus the  $\langle code \rangle$  should define a function of one argument (#1).

\int\_step\_variable:nnnNn

New: 2012-06-04 Updated: 2014-05-30

This function first evaluates the  $\langle initial\ value \rangle$ ,  $\langle step \rangle$  and  $\langle final\ value \rangle$ , all of which should be integer expressions. Then for each  $\langle value \rangle$  from the  $\langle initial\ value \rangle$  to the  $\langle final\ value \rangle$  in turn (using  $\langle step \rangle$  between each  $\langle value \rangle$ ), the  $\langle code \rangle$  is inserted into the input stream, with the  $\langle tl\ var \rangle$  defined as the current  $\langle value \rangle$ . Thus the  $\langle code \rangle$  should make use of the  $\langle tl\ var \rangle$ .

# 8 Formatting integers

Integers can be placed into the output stream with formatting. These conversions apply to any integer expressions.

\int\_to\_arabic:n \*

\int\_to\_arabic:n {\(\langle integer expression\\rangle \rangle}\)

Updated: 2011-10-22

Places the value of the  $\langle integer\ expression \rangle$  in the input stream as digits, with category code 12 (other).

```
\int_to_alph:n *
\int_to_Alph:n *
```

Updated: 2011-09-17

Evaluates the  $\langle integer\ expression \rangle$  and converts the result into a series of letters, which are then left in the input stream. The conversion rule uses the 26 letters of the English alphabet, in order, adding letters when necessary to increase the total possible range of representable numbers. Thus

```
\int_to_alph:n { 1 }
places a in the input stream,
```

```
\int_to_alph:n { 26 }
```

is represented as z and

```
\int_to_alph:n { 27 }
```

is converted to aa. For conversions using other alphabets, use \int\_to\_symbols:nnn to define an alphabet-specific function. The basic \int\_to\_alph:n and \int\_to\_Alph:n functions should not be modified. The resulting tokens are digits with category code 12 (other) and letters with category code 11 (letter).

Updated: 2011-09-17

```
\begin{tabular}{ll} $$ \inf_to_symbols:nnn $$ {\langle integer\ expression \rangle} $$ {\langle total\ symbols \rangle} $$ {\langle value\ to\ symbol\ mapping \rangle} $$ \end{tabular}
```

This is the low-level function for conversion of an  $\langle integer\ expression \rangle$  into a symbolic form (which will often be letters). The  $\langle total\ symbols \rangle$  available should be given as an integer expression. Values are actually converted to symbols according to the  $\langle value\ to\ symbol\ mapping \rangle$ . This should be given as  $\langle total\ symbols \rangle$  pairs of entries, a number and the appropriate symbol. Thus the \int\_to\_alph:n function is defined as

```
\cs_new:Npn \int_to_alph:n #1
{
    \int_to_symbols:nnn {#1} { 26 }
    {
        { 1 } { a }
        { 2 } { b }
        ...
        { 26 } { z }
    }
}
```

\int\_to\_bin:n ★

\int\_to\_bin:n {\langle integer expression \rangle}

New: 2014-02-11

Calculates the value of the  $\langle integer\ expression \rangle$  and places the binary representation of the result in the input stream.

\int\_to\_hex:n \*
\int\_to\_Hex:n \*

\int\_to\_hex:n {\langle integer expression \rangle}

New: 2014-02-11

Calculates the value of the *(integer expression)* and places the hexadecimal (base 16) representation of the result in the input stream. Letters are used for digits beyond 9: lower case letters for *\int\_to\_hex:n* and upper case ones for *\int\_to\_Hex:n*. The resulting tokens are digits with category code 12 (other) and letters with category code 11 (letter).

\int\_to\_oct:n \*

\int\_to\_oct:n {\( \( \) integer expression \\ \)}

New: 2014-02-11

Calculates the value of the *(integer expression)* and places the octal (base 8) representation of the result in the input stream. The resulting tokens are digits with category code 12 (other) and letters with category code 11 (letter).

\int\_to\_base:nn \*
\int\_to\_Base:nn \*

Updated: 2014-02-11

Calculates the value of the  $\langle integer\ expression \rangle$  and converts it into the appropriate representation in the  $\langle base \rangle$ ; the later may be given as an integer expression. For bases greater than 10 the higher "digits" are represented by letters from the English alphabet: lower case letters for  $\langle int_to_base:n$  and upper case ones for  $\langle int_to_base:n$ . The maximum  $\langle base \rangle$  value is 36. The resulting tokens are digits with category code 12 (other) and letters with category code 11 (letter).

TeXhackers note: This is a generic version of \int\_to\_bin:n, etc.

\int\_to\_roman:n ☆ \int\_to\_Roman:n ☆ \int\_to\_roman:n {\(\langle integer expression\\)}

Updated: 2011-10-22

Places the value of the  $\langle integer\ expression \rangle$  in the input stream as Roman numerals, either lower case (\int\_to\_roman:n) or upper case (\int\_to\_Roman:n). The Roman numerals are letters with category code 11 (letter).

# 9 Converting from other formats to integers

\int\_from\_alph:n \*

Updated: 2014-08-25

Converts the  $\langle letters \rangle$  into the integer (base 10) representation and leaves this in the input stream. The  $\langle letters \rangle$  are first converted to a string, with no expansion. Lower and upper case letters from the English alphabet may be used, with "a" equal to 1 through to "z" equal to 26. The function also accepts a leading sign, made of + and -. This is the inverse function of \int\_to\_alph:n and \int\_to\_Alph:n.

\int\_from\_bin:n ★

New: 2014-02-11 Updated: 2014-08-25 Converts the  $\langle binary\ number \rangle$  into the integer (base 10) representation and leaves this in the input stream. The  $\langle binary\ number \rangle$  is first converted to a string, with no expansion. The function accepts a leading sign, made of + and -, followed by binary digits. This is the inverse function of  $\int int_b$ .

\int\_from\_hex:n \*

\int\_from\_hex:n {\langle hexadecimal number \rangle}

New: 2014-02-11 Updated: 2014-08-25 \int\_from\_oct:n \*

\int\_from\_oct:n {\langle octal number \rangle}

New: 2014-02-11 Updated: 2014-08-25 Converts the  $\langle octal\ number \rangle$  into the integer (base 10) representation and leaves this in the input stream. The  $\langle octal\ number \rangle$  is first converted to a string, with no expansion. The function accepts a leading sign, made of + and -, followed by octal digits. This is the inverse function of  $\int_{to_oct:n}$ .

\int\_from\_roman:n \*

\int\_from\_roman:n {\langle roman numeral \rangle}

Updated: 2014-08-25

\int\_from\_base:nn \*

Updated: 2014-08-25

Converts the  $\langle number \rangle$  expressed in  $\langle base \rangle$  into the appropriate value in base 10. The  $\langle number \rangle$  is first converted to a string, with no expansion. The  $\langle number \rangle$  should consist of digits and letters (either lower or upper case), plus optionally a leading sign. The maximum  $\langle base \rangle$  value is 36. This is the inverse function of \int\_to\_base:nn and \int\_-to\_Base:nn.

# 10 Viewing integers

\int\_show:N

\int\_show:N \( \( \) integer \( \)

\int\_show:c

Displays the value of the  $\langle integer \rangle$  on the terminal.

\int\_show:n

\int\_show:n {\(\langle integer expression\\)}

New: 2011-11-22 Updated: 2015-08-07 Displays the result of evaluating the  $\langle integer\ expression \rangle$  on the terminal.

76

# 11 Constant integers

\c\_minus\_one \c\_zero \c\_one \c\_two \c\_three \c\_four  $\c_five$ \c\_six \c\_seven \c\_eight \c\_nine \c\_ten \c\_eleven \c\_twelve \c\_thirteen  $\c_fourteen$ \c\_fifteen \c\_sixteen \c\_thirty\_two \c\_one\_hundred \c\_two\_hundred\_fifty\_five \c\_two\_hundred\_fifty\_six  $\c_{one\_thousand}$ 

Integer values used with primitive tests and assignments: self-terminating nature makes these more convenient and faster than literal numbers.

 $\c_{max_int}$ 

The maximum value that can be stored as an integer.

\c\_max\_register\_int

\c\_ten\_thousand

Maximum number of registers.

# 12 Scratch integers

\l\_tmpa\_int
\l\_tmpb\_int

Scratch integer for local assignment. These are never used by the kernel code, and so are safe for use with any LATEX3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.

\g\_tmpa\_int \g\_tmpb\_int Scratch integer for global assignment. These are never used by the kernel code, and so are safe for use with any LATEX3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.

#### 13 Primitive conditionals

Compare two integers using  $\langle relation \rangle$ , which must be one of =, < or > with category code 12. The **\else**: branch is optional.

TeXhackers note: These are both names for the TeX primitive \ifnum.

Selects a case to execute based on the value of the  $\langle integer \rangle$ . The first case  $(\langle case_0 \rangle)$  is executed if  $\langle integer \rangle$  is 0, the second  $(\langle case_1 \rangle)$  if the  $\langle integer \rangle$  is 1, etc. The  $\langle integer \rangle$  may be a literal, a constant or an integer expression (e.g. using \int\_eval:n).

TEXhackers note: These are the TEX primitives \ifcase and \or.

Expands  $\langle tokens \rangle$  until a non-numeric token or a space is found, and tests whether the resulting  $\langle integer \rangle$  is odd. If so,  $\langle true\ code \rangle$  is executed. The **\else**: branch is optional.

TEXhackers note: This is the TEX primitive \ifodd.

#### 14 Internal functions

```
\__int_to_roman:w * \__int_to_roman:w \land integer \land \space \rangle or \land non-expandable token \rangle
```

Converts  $\langle integer \rangle$  to it lower case Roman representation. Expansion ends when a space or non-expandable token is found. Note that this function produces a string of letters with category code 12 and that protected functions are expanded by this process. Negative  $\langle integer \rangle$  values result in no output, although the function does not terminate expansion until a suitable endpoint is found in the same way as for positive numbers.

TeXhackers note: This is the TeX primitive \romannumeral renamed.

```
\__int_value:w *
```

```
\label{lem:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue:walue
```

Expands  $\langle tokens \rangle$  until an  $\langle integer \rangle$  is formed. One space may be gobbled in the process.

TEXhackers note: This is the TEX primitive \number.

```
\verb|\|\_int_eval:w| \langle intexpr \rangle \ \verb|\|\_int_eval\_end:
```

Evaluates \(\int\_{\text{eval:n.}}\) as described for \\int\_{\text{eval:n.}}\). The evaluation stops when an unexpandable token which is not a valid part of an integer is read or when \\\_\_int\_-\text{eval\_end:}\) is reached. The latter is gobbled by the scanner mechanism: \\\_\_int\_{\text{eval}\_-\text{end:}}\) end: itself is unexpandable but used correctly the entire construct is expandable.

**TEXhackers note:** This is the  $\varepsilon$ -TEX primitive \numexpr.

\\_\_prg\_compare\_error: \\_\_prg\_compare\_error:Nw

```
\__prg_compare_error:
\__prg_compare_error:Nw \( token \)
```

These are used within \int\_compare:n(TF), \dim\_compare:n(TF) and so on to recover correctly if the n-type argument does not contain a properly-formed relation.

#### Part X

New: 2012-03-03

# The l3skip package Dimensions and skips

LATEX3 provides two general length variables: dim and skip. Lengths stored as dim variables have a fixed length, whereas skip lengths have a rubber (stretch/shrink) component. In addition, the muskip type is available for use in math mode: this is a special form of skip where the lengths involved are determined by the current math font (in mu). There are common features in the creation and setting of length variables, but for clarity the functions are grouped by variable type.

#### 1 Creating and initialising dim variables

\dim\_new:N \dimension \ \dim\_new:N \dim\_new:c Creates a new  $\langle dimension \rangle$  or raises an error if the name is already taken. The declaration is global. The  $\langle dimension \rangle$  will initially be equal to 0 pt.  $\verb|\dim_const:Nn| \langle dimension \rangle \{ \langle dimension| expression \rangle \}$ \dim\_const:Nn \dim\_const:cn Creates a new constant  $\langle dimension \rangle$  or raises an error if the name is already taken. The New: 2012-03-05 value of the  $\langle dimension \rangle$  will be set globally to the  $\langle dimension \ expression \rangle$ . \dim\_zero:N \dimension \ \dim\_zero:N \dim\_zero:c Sets  $\langle dimension \rangle$  to 0 pt. \dim\_gzero:N \dim\_gzero:c \dim\_zero\_new:N \dimension \ \dim\_zero\_new:N \dim\_zero\_new:c Ensures that the \( \dimension \) exists globally by applying \\dim\_new: \( \text{N} \) if necessary, then \dim\_gzero\_new:N applies  $\dim_{g}$  zero: N to leave the  $\langle dimension \rangle$  set to zero. \dim\_gzero\_new:c New: 2012-01-07 \dim\_if\_exist\_p:N \dimension \ \dim\_if\_exist\_p:N \*  $\label{lem:dim_if_exist:NTF} $$ \dim_{if} exist:NTF $$ \langle dimension \rangle $$ {\true code} \} $$ {\dim_{if} exist:NTF $$ \langle dimension \rangle $$ } $$$ \dim\_if\_exist\_p:c \dim\_if\_exist:NTF Tests whether the  $\langle dimension \rangle$  is currently defined. This does not check that the \dim\_if\_exist:cTF \*  $\langle dimension \rangle$  really is a dimension variable.

#### $\mathbf{2}$ Setting dim variables

\dim\_add:Nn  $\dim_{add}: Nn \ (dimension) \ {(dimension \ expression)}$ \dim\_add:cn Adds the result of the  $\langle dimension \ expression \rangle$  to the current content of the  $\langle dimension \rangle$ . \dim\_gadd:Nn \dim\_gadd:cn Updated: 2011-10-22 \dim\_set:Nn \dimension \ \{\dimension expression\}\ \dim\_set:Nn \dim\_set:cn Sets  $\langle dimension \rangle$  to the value of  $\langle dimension \ expression \rangle$ , which must evaluate to a length \dim\_gset:Nn with units. \dim\_gset:cn Updated: 2011-10-22  $\dim_{\text{set\_eq:NN}} \langle dimension_1 \rangle \langle dimension_2 \rangle$ \dim\_set\_eq:NN \dim\_set\_eq:(cN|Nc|cc) Sets the content of  $\langle dimension_1 \rangle$  equal to that of  $\langle dimension_2 \rangle$ . \dim\_gset\_eq:NN \dim\_gset\_eq:(cN|Nc|cc) \dim\_sub:Nn \dim\_sub:Nn \dimension \ \{\dimension expression\}

\dim\_sub:cn \dim\_gsub:Nn \dim\_gsub:cn

Subtracts the result of the (dimension expression) from the current content of the  $\langle dimension \rangle$ .

Updated: 2011-10-22

#### 3 Utilities for dimension calculations

\dim\_abs:n  $\dim_abs:n \{\langle dimexpr \rangle\}$ 

Updated: 2012-09-26 Converts the  $\langle dimexpr \rangle$  to its absolute value, leaving the result in the input stream as a  $\langle dimension \ denotation \rangle$ .

 $\dim_{\max}: nn \{\langle dimexpr_1 \rangle\} \{\langle dimexpr_2 \rangle\}$ \dim\_max:nn  $\dim_{\min} : nn \{\langle dimexpr_1 \rangle\} \{\langle dimexpr_2 \rangle\}$ \dim\_min:nn

Evaluates the two  $\langle dimension \ expressions \rangle$  and leaves either the maximum or minimum New: 2012-09-09 value in the input stream as appropriate, as a  $\langle dimension \ denotation \rangle$ . Updated: 2012-09-26

```
\dim_ratio:nn 🜣
```

```
\dim_{\operatorname{ratio:nn}} \{\langle \operatorname{dimexpr}_1 \rangle\} \{\langle \operatorname{dimexpr}_2 \rangle\}
```

Updated: 2011-10-22

Parses the two  $\langle dimension \ expressions \rangle$  and converts the ratio of the two to a form suitable for use inside a  $\langle dimension \ expression \rangle$ . This ratio is then left in the input stream, allowing syntax such as

```
\dim_set:Nn \l_my_dim { 10 pt * \dim_ratio:nn { 5 pt } { 10 pt } }
```

The output of \dim\_ratio:nn on full expansion is a ration expression between two integers, with all distances converted to scaled points. Thus

```
\tl_set:Nx \l_my_tl { \dim_ratio:nn { 5 pt } { 10 pt } }
\tl_show:N \l_my_tl
```

will display 327680/655360 on the terminal.

## 4 Dimension expression conditionals

\dim\_compare\_p:nNn \* \dim\_compare:nNn<u>TF</u> \*

This function first evaluates each of the  $\langle dimension \ expressions \rangle$  as described for  $\dim_-$  eval:n. The two results are then compared using the  $\langle relation \rangle$ :

Equal = Greater than Less than

 $\{\langle true\ code \rangle\}\ \{\langle false\ code \rangle\}$ 

This function evaluates the  $\langle dimension \; expressions \rangle$  as described for  $\langle dim\_eval:n$  and compares consecutive result using the corresponding  $\langle relation \rangle$ , namely it compares  $\langle dimexpr_1 \rangle$  and  $\langle dimexpr_2 \rangle$  using the  $\langle relation_1 \rangle$ , then  $\langle dimexpr_2 \rangle$  and  $\langle dimexpr_3 \rangle$  using the  $\langle relation_2 \rangle$ , until finally comparing  $\langle dimexpr_N \rangle$  and  $\langle dimexpr_{N+1} \rangle$  using the  $\langle relation_N \rangle$ . The test yields true if all comparisons are true. Each  $\langle dimension \; expression \rangle$  is evaluated only once, and the evaluation is lazy, in the sense that if one comparison is false, then no other  $\langle dimension \; expression \rangle$  is evaluated and no other comparison is performed. The  $\langle relations \rangle$  can be any of the following:

```
Equal = or ==
Greater than or equal to >=
Greater than >=
Less than or equal to <=
Less than <
Not equal !=
```

```
\frac{\text{\ \ }\text{\ \ \ }\text{\ \ }\text{\
```

```
\label{eq:case:nnTF} $$ \langle test \ dimension \ expression \rangle $$ $$ \{ \langle dimexpr \ case_1 \rangle \} \ \{ \langle code \ case_2 \rangle \} \ \dots \ \{ \langle dimexpr \ case_n \rangle \} \ \{ \langle code \ case_n \rangle \} \} $$ $$ \{ \langle true \ code \rangle \} $$ $$ \{ \langle false \ code \rangle \} $$
```

This function evaluates the  $\langle test\ dimension\ expression \rangle$  and compares this in turn to each of the  $\langle dimension\ expression\ cases \rangle$ . If the two are equal then the associated  $\langle code \rangle$  is left in the input stream. If any of the cases are matched, the  $\langle true\ code \rangle$  is also inserted into the input stream (after the code for the appropriate case), while if none match then the  $\langle false\ code \rangle$  is inserted. The function  $\dim_case:nn$ , which does nothing if there is no match, is also available. For example

will leave "Medium" in the input stream.

# 5 Dimension expression loops

\dim\_do\_until:nNnn ☆

```
\label{local_dim_do_until:nNnn} $$ \langle dimexpr_1 \rangle \} \ \langle relation \rangle \ $$ \{\langle dimexpr_2 \rangle \} \ $$ \{\langle code \rangle \}$ $$
```

Places the  $\langle code \rangle$  in the input stream for TeX to process, and then evaluates the relationship between the two  $\langle dimension\ expressions \rangle$  as described for \dim\_compare:nNnTF. If the test is false then the  $\langle code \rangle$  will be inserted into the input stream again and a loop will occur until the  $\langle relation \rangle$  is true.

\dim\_do\_while:nNnn 🕏

```
\label{lem:lem:nnn} $$ \dim_{\infty} \operatorname{lem:nnn} {\langle \dim \operatorname{conn} \rangle} {\langle \operatorname{code} \rangle} $$
```

Places the  $\langle code \rangle$  in the input stream for TEX to process, and then evaluates the relationship between the two  $\langle dimension\ expressions \rangle$  as described for \dim\_compare:nNnTF. If the test is true then the  $\langle code \rangle$  will be inserted into the input stream again and a loop will occur until the  $\langle relation \rangle$  is false.

\dim\_until\_do:nNnn 🌣

 $\dim_until_do:nNnn \ \{\langle dimexpr_1 \rangle\} \ \langle relation \rangle \ \{\langle dimexpr_2 \rangle\} \ \{\langle code \rangle\}$ 

Evaluates the relationship between the two  $\langle dimension \ expressions \rangle$  as described for  $\langle dim\_compare:nNnTF$ , and then places the  $\langle code \rangle$  in the input stream if the  $\langle relation \rangle$  is false. After the  $\langle code \rangle$  has been processed by TEX the test will be repeated, and a loop will occur until the test is true.

\dim\_while\_do:nNnn ☆

 $\dim_{\min} {\dim_{n} {\dim_{n}}} {\dim_{n} {\dim_{n}}} {\dim_{n} {\dim_{n}}} {\dim_{n} {\dim_{n}}} {\dim_{n}}$ 

Evaluates the relationship between the two  $\langle dimension \ expressions \rangle$  as described for  $\langle dim\_compare:nNnTF$ , and then places the  $\langle code \rangle$  in the input stream if the  $\langle relation \rangle$  is true. After the  $\langle code \rangle$  has been processed by TEX the test will be repeated, and a loop will occur until the test is false.

\dim\_do\_until:nn ☆

 $\dim_{do\_until:nn} {\langle dimension \ relation \rangle} {\langle code \rangle}$ 

Updated: 2013-01-13

Places the  $\langle code \rangle$  in the input stream for TEX to process, and then evaluates the  $\langle dimension\ relation \rangle$  as described for \dim\_compare:nTF. If the test is false then the  $\langle code \rangle$  will be inserted into the input stream again and a loop will occur until the  $\langle relation \rangle$  is true.

\dim\_do\_while:nn ☆

 $\dim_{o}$  while:nn { $\dim_{o}$  relation}} { $\dim_{o}$ 

Updated: 2013-01-13

Places the  $\langle code \rangle$  in the input stream for TEX to process, and then evaluates the  $\langle dimension\ relation \rangle$  as described for  $\dim_compare:nTF$ . If the test is true then the  $\langle code \rangle$  will be inserted into the input stream again and a loop will occur until the  $\langle relation \rangle$  is false.

\dim\_until\_do:nn ☆

 $\dim_{\operatorname{until\_do:nn}} {\langle \operatorname{dimension} \ \operatorname{relation} \rangle} {\langle \operatorname{code} \rangle}$ 

Updated: 2013-01-13

Evaluates the  $\langle dimension \ relation \rangle$  as described for  $\langle dim\_compare:nTF$ , and then places the  $\langle code \rangle$  in the input stream if the  $\langle relation \rangle$  is false. After the  $\langle code \rangle$  has been processed by  $T_FX$  the test will be repeated, and a loop will occur until the test is true.

\dim\_while\_do:nn ☆

 $\verb|\dim_while_do:nn {| (dimension relation)|} {| (code)|}$ 

Updated: 2013-01-13

Evaluates the  $\langle dimension \ relation \rangle$  as described for  $\backslash dim\_compare:nTF$ , and then places the  $\langle code \rangle$  in the input stream if the  $\langle relation \rangle$  is true. After the  $\langle code \rangle$  has been processed by  $T_FX$  the test will be repeated, and a loop will occur until the test is false.

# 6 Using dim expressions and variables

\dim\_eval:n

 $\dim_{\text{eval:n}} \{\langle \text{dimension expression} \rangle\}$ 

Updated: 2011-10-22

Evaluates the  $\langle dimension \; expression \rangle$ , expanding any dimensions and token list variables within the  $\langle expression \rangle$  to their content (without requiring  $\dim_use:N/\tl_use:N$ ) and applying the standard mathematical rules. The result of the calculation is left in the input stream as a  $\langle dimension \; denotation \rangle$  after two expansions. This will be expressed in points (pt), and will require suitable termination if used in a TeX-style assignment as it is not an  $\langle internal \; dimension \rangle$ .

\dim\_use:N

\dim\_use:N \dimension \

\dim\_use:c

Recovers the content of a  $\langle dimension \rangle$  and places it directly in the input stream. An error will be raised if the variable does not exist or if it is invalid. Can be omitted in places where a  $\langle dimension \rangle$  is required (such as in the argument of  $\dim_eval:n$ ).

**TEXhackers note:**  $\dim_{use:N}$  is the TEX primitive the: this is one of several <math>ATEX3 names for this primitive.

\dim\_to\_decimal:n ★

 $\dim_{to} decimal:n \{\langle dimexpr \rangle\}$ 

New: 2014-07-15

Evaluates the  $\langle dimension \; expression \rangle$ , and leaves the result, expressed in points (pt) in the input stream, with no units. The result is rounded by  $T_EX$  to four or five decimal places. If the decimal part of the result is zero, it is omitted, together with the decimal marker.

For example

```
\dim_to_decimal:n { 1bp }
```

leaves 1.00374 in the input stream, *i.e.* the magnitude of one "big point" when converted to  $(T_EX)$  points.

\dim\_to\_decimal\_in\_bp:n \*

\dim\_to\_decimal\_in\_bp:n {\dimexpr\}

New: 2014-07-15

Evaluates the  $\langle dimension \; expression \rangle$ , and leaves the result, expressed in big points (bp) in the input stream, with *no units*. The result is rounded by TEX to four or five decimal places. If the decimal part of the result is zero, it is omitted, together with the decimal marker.

For example

```
\dim_to_decimal_in_bp:n { 1pt }
```

leaves 0.99628 in the input stream, *i.e.* the magnitude of one (TEX) point when converted to big points.

\dim\_to\_decimal\_in\_sp:n \*

 $\verb|\dim_to_decimal_in_sp:n {|} {|} dimexpr |$ 

New: 2015-05-18

Evaluates the  $\langle dimension \; expression \rangle$ , and leaves the result, expressed in scaled points (sp) in the input stream, with no units. The result will necessarily be an integer.

Evaluates the  $\langle dimension \ expressions \rangle$ , and leaves the value of  $\langle dimexpr_1 \rangle$ , expressed in a unit given by  $\langle dimexpr_2 \rangle$ , in the input stream. The result is a decimal number, rounded by TeX to four or five decimal places. If the decimal part of the result is zero, it is omitted, together with the decimal marker.

For example

```
\dim_to_decimal_in_unit:nn { 1bp } { 1mm }
```

leaves 0.35277 in the input stream, *i.e.* the magnitude of one big point when converted to millimetres.

Note that this function is not optimised for any particular output and as such may give different results to  $\dim_{to} = \dim_{in} p:n$  or  $\dim_{to} = \dim_{in} p:n$ . In particular, the latter is able to take a wider range of input values as it is not limited by the ability to calculate a ratio using  $\varepsilon$ -TEX primitives, which is required internally by  $\dim_{to} = \dim_{to} p$ .

```
\dim_to_fp:n ★
```

 $\dim_{to_{fp:n} {\langle dimexpr \rangle}}$ 

New: 2012-05-08

Expands to an internal floating point number equal to the value of the  $\langle dimexpr \rangle$  in pt. Since dimension expressions are evaluated much faster than their floating point equivalent,  $\dim_{to}fp:n$  can be used to speed up parts of a computation where a low precision is acceptable.

# 7 Viewing dim variables

\dim\_show:N \dim\_show:N \dimension \

 $\underline{\dim_{\underline{show}:c}}$  Displays the value of the  $\langle dimension \rangle$  on the terminal.

\dim\_show:n \dim\_show:n {\dimension expression}}

New: 2011-11-22

Displays the result of evaluating the  $\langle dimension \ expression \rangle$  on the terminal.

Updated: 2015-08-07

#### 8 Constant dimensions

The maximum value that can be stored as a dimension. This can also be used as a component of a skip.

\c\_zero\_dim A zero length as a dimension. This can also be used as a component of a skip.

#### 9 Scratch dimensions

\l\_tmpa\_dim
\l\_tmpb\_dim

Scratch dimension for local assignment. These are never used by the kernel code, and so are safe for use with any LATEX3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.

\g\_tmpa\_dim \g\_tmpb\_dim Scratch dimension for global assignment. These are never used by the kernel code, and so are safe for use with any IATEX3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.

# 10 Creating and initialising skip variables

\skip\_new:N

 $\sline \sline \sline$ 

\skip\_new:c

Creates a new  $\langle skip \rangle$  or raises an error if the name is already taken. The declaration is global. The  $\langle skip \rangle$  will initially be equal to 0 pt.

\skip\_const:Nn \skip\_const:cn  $\sin const: Nn \langle skip \rangle \{\langle skip \ expression \rangle\}$ 

New: 2012-03-05

Creates a new constant  $\langle skip \rangle$  or raises an error if the name is already taken. The value of the  $\langle skip \rangle$  will be set globally to the  $\langle skip \rangle$  expression.

\skip\_zero:N \skip\_zero:c \skip\_gzero:N  $\sline \sline \sline$ 

\skip\_zero:N \skip\_gzero:C \Sets \langle skip \rangle to 0 pt.

\skip\_zero\_new:N \skip\_zero\_new:c

 $\sline \sline \sline$ 

\skip\_gzero\_new:N \skip\_gzero\_new:c Ensures that the  $\langle skip \rangle$  exists globally by applying \skip\_new:N if necessary, then applies \skip\_(g)zero:N to leave the  $\langle skip \rangle$  set to zero.

New: 2012-01-07

New: 2012-03-03

\skip\_if\_exist\_p:N \*
\skip\_if\_exist\_p:c \*
\skip\_if\_exist:NTF \*
\skip\_if\_exist:cTF \*

\skip\_if\_exist\_p:N \( \skip \)

 $\verb|\skip_if_exist:NTF| $$\langle skip \rangle $ \{\langle true \ code \rangle \} $$ \{\langle false \ code \rangle \}$$ 

Tests whether the  $\langle skip \rangle$  is currently defined. This does not check that the  $\langle skip \rangle$  really is a skip variable.

#### 11 Setting skip variables

\skip\_add:Nn \skip\_add:cn \skip\_gadd:Nn \skip\_gadd:cn

Adds the result of the  $\langle skip \; expression \rangle$  to the current content of the  $\langle skip \rangle$ .

Updated: 2011-10-22

\skip\_set:Nn \skip\_set:cn \skip\_gset:Nn \skip\_gset:cn Sets  $\langle skip \rangle$  to the value of  $\langle skip \; expression \rangle$ , which must evaluate to a length with units and may include a rubber component (for example 1 cm plus 0.5 cm.

Updated: 2011-10-22

\skip\_set\_eq:NN \skip\_set\_eq:(cN|Nc|cc) \skip\_gset\_eq:NN \skip\_gset\_eq:(cN|Nc|cc)  $\sline \sline \sline$ 

Sets the content of  $\langle skip_1 \rangle$  equal to that of  $\langle skip_2 \rangle$ .

\skip\_sub:Nn \skip\_sub:cn \skip\_gsub:Nn \skip\_gsub:cn  $\sline \sline \sline$ 

Subtracts the result of the  $\langle skip \; expression \rangle$  from the current content of the  $\langle skip \rangle$ .

Updated: 2011-10-22

# 12 Skip expression conditionals

```
\begin{tabular}{ll} $\langle skipexpr_1 \rangle \} & \langle skipexpr_2 \rangle \} \\ & \langle skipexpr_1 \rangle \} & \langle \langle skipexpr_2 \rangle \} \\ & \langle \langle skipexpr_1 \rangle \} & \langle \langle skipexpr_2 \rangle \} \\ & \langle \langle skipexpr_2 \rangle \} & \langle \langle skipexpr_2 \rangle \} \\ & \langle \langle skipexpr_2 \rangle \} & \langle \langle skipexpr_2 \rangle \} & \langle \langle skipexpr_2 \rangle \} \\ & \langle \langle skipexpr_2 \rangle \} & \langle \langle skipexpr_2 \rangle + \langle \langle sk
```

This function first evaluates each of the  $\langle skip \; expressions \rangle$  as described for \skip\_-eval:n. The two results are then compared for exact equality, *i.e.* both the fixed and rubber components must be the same for the test to be true.

```
\skip_if_finite_p:n *
\skip_if_finite:nTF *
```

New: 2012-03-05

Evaluates the  $\langle skip\ expression \rangle$  as described for \skip\_eval:n, and then tests if all of its components are finite.

## 13 Using skip expressions and variables

\skip\_eval:n ★

 $\sin {\langle skip expression \rangle}$ 

Updated: 2011-10-22

Evaluates the  $\langle skip \; expression \rangle$ , expanding any skips and token list variables within the  $\langle expression \rangle$  to their content (without requiring \skip\_use:N/\tl\_use:N) and applying the standard mathematical rules. The result of the calculation is left in the input stream as a  $\langle glue \; denotation \rangle$  after two expansions. This will be expressed in points (pt), and will require suitable termination if used in a TeX-style assignment as it is not an  $\langle internal \; glue \rangle$ .

\skip\_use:N \*
\skip\_use:c \*

\skip\_use:N \( skip \)

Recovers the content of a  $\langle skip \rangle$  and places it directly in the input stream. An error will be raised if the variable does not exist or if it is invalid. Can be omitted in places where a  $\langle dimension \rangle$  is required (such as in the argument of \skip\_eval:n).

**TEXhackers note:**  $\$  is the TEX primitive  $\$  this is one of several  $\$  names for this primitive.

## 14 Viewing skip variables

\skip\_show: N

\skip\_show:N \( skip \)

\skip\_show:c

Displays the value of the  $\langle skip \rangle$  on the terminal.

\skip\_show:n

 $\sin {\langle skip expression \rangle}$ 

New: 2011-11-22

Displays the result of evaluating the  $\langle skip \; expression \rangle$  on the terminal.

Updated: 2015-08-07

# 15 Constant skips

\c\_max\_skip

Updated: 2012-11-02

The maximum value that can be stored as a skip (equal to \c\_max\_dim in length), with no stretch nor shrink component.

\c\_zero\_skip

A zero length as a skip, with no stretch nor shrink component.

Updated: 2012-11-01

#### 16 Scratch skips

\l\_tmpa\_skip
\l\_tmpb\_skip

Scratch skip for local assignment. These are never used by the kernel code, and so are safe for use with any LATEX3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.

\g\_tmpa\_skip \g\_tmpb\_skip Scratch skip for global assignment. These are never used by the kernel code, and so are safe for use with any LaTeX3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.

## 17 Inserting skips into the output

\skip\_horizontal:N \skip\_horizontal:c

\skip\_horizontal:N  $\langle skip \rangle$  \skip\_horizontal:n  $\{\langle skipexpr \rangle\}$ 

\skip\_horizontal:n

Inserts a horizontal  $\langle skip \rangle$  into the current list.

Updated: 2011-10-22

TFXhackers note: \skip\_horizontal:N is the TFX primitive \hskip renamed.

\skip\_vertical:N \skip\_vertical:c

\skip\_vertical:N  $\langle skip \rangle$  \skip\_vertical:n  $\{\langle skipexpr \rangle\}$ 

\skip\_vertical:n

Inserts a vertical  $\langle skip \rangle$  into the current list.

Updated: 2011-10-22

TFXhackers note: \skip\_vertical:N is the TFX primitive \vskip renamed.

# 18 Creating and initialising muskip variables

\muskip\_new:N
\muskip\_new:c

\muskip\_new:N \langle muskip \rangle

Creates a new  $\langle muskip \rangle$  or raises an error if the name is already taken. The declaration is global. The  $\langle muskip \rangle$  will initially be equal to 0 mu.

\muskip\_const:Nn
\muskip\_const:cn

 $\mbox{\mbox{\tt muskip\_const:Nn}} \mbox{\mbox{\tt muskip}} \mbox{\mbox{\mbox{\tt (muskip expression)}}}$ 

New: 2012-03-05

Creates a new constant  $\langle muskip \rangle$  or raises an error if the name is already taken. The value of the  $\langle muskip \rangle$  will be set globally to the  $\langle muskip \rangle$  expression.

\muskip\_zero:N
\muskip\_zero:C
\muskip\_gzero:C
\muskip\_gzero:C

\skip\_zero:N \langle muskip \rangle

Sets  $\langle muskip \rangle$  to 0 mu.

\muskip\_zero\_new:N

\muskip\_zero\_new:N \langle muskip \rangle

\muskip\_zero\_new:c \muskip\_gzero\_new:N

Ensures that the  $\langle muskip \rangle$  exists globally by applying \muskip\_new: N if necessary, then applies  $\mbox{muskip}_{(g)}$ zero: N to leave the  $\mbox{muskip}$  set to zero.

\muskip\_gzero\_new:c

New: 2012-01-07

 $\mbox{\mbox{\tt muskip\_if\_exist:NTF}} \ \mbox{\mbox{\tt muskip}} \ \{\mbox{\mbox{\tt true}} \ \mbox{\tt code}\}\} \ \mbox{\mbox{\tt false}} \ \mbox{\tt code}\}$  $\mbox{\mbox{\mbox{$m$uskip$_if$_exist$_p:c$}} \star$ 

\muskip\_if\_exist\_p:N \langle muskip \rangle

\muskip\_if\_exist:NTF \* Tests whether the  $\langle muskip \rangle$  is currently defined. This does not check that the  $\langle muskip \rangle$ \muskip\_if\_exist:cTF \* really is a muskip variable.

\muskip\_if\_exist\_p:N \*

New: 2012-03-03

#### 19 Setting muskip variables

\muskip\_add:Nn

\muskip\_add: Nn \langle muskip \rangle \langle muskip expression \rangle \rangle

\muskip\_add:cn

Adds the result of the  $\langle muskip \; expression \rangle$  to the current content of the  $\langle muskip \rangle$ .

\muskip\_gadd:Nn \muskip\_gadd:cn

Updated: 2011-10-22

\muskip\_set:Nn

\muskip set:cn

\muskip\_gset:Nn

\muskip\_gset:cn

Updated: 2011-10-22

\muskip\_set:Nn \langle muskip \langle \langle muskip expression \rangle \rangle

Sets  $\langle muskip \rangle$  to the value of  $\langle muskip \ expression \rangle$ , which must evaluate to a math length with units and may include a rubber component (for example 1 mu plus 0.5 mu.

\muskip\_set\_eq:NN

\muskip\_set\_eq:(cN|Nc|cc)

\muskip\_gset\_eq:NN \muskip\_gset\_eq:(cN|Nc|cc) Sets the content of  $\langle muskip_1 \rangle$  equal to that of  $\langle muskip_2 \rangle$ .

\muskip\_sub:Nn \muskip\_sub:cn \muskip\_sub: Nn \langle muskip \rangle \langle muskip expression \rangle \rangle

\muskip\_gsub:Nn

\muskip\_gsub:cn

Updated: 2011-10-22

Subtracts the result of the  $\langle muskip \ expression \rangle$  from the current content of the  $\langle skip \rangle$ .

# 20 Using muskip expressions and variables

\muskip\_eval:n ★

\muskip\_eval:n {\muskip expression}}

Updated: 2011-10-22

Evaluates the  $\langle muskip \; expression \rangle$ , expanding any skips and token list variables within the  $\langle expression \rangle$  to their content (without requiring \muskip\_use:N/\tl\_use:N) and applying the standard mathematical rules. The result of the calculation is left in the input stream as a  $\langle muglue \; denotation \rangle$  after two expansions. This will be expressed in mu, and will require suitable termination if used in a TeX-style assignment as it is not an  $\langle internal \; muglue \rangle$ .

\muskip\_use:N \*
\muskip\_use:c \*

 $\verb|\muskip_use:N| \langle muskip \rangle|$ 

Recovers the content of a  $\langle skip \rangle$  and places it directly in the input stream. An error will be raised if the variable does not exist or if it is invalid. Can be omitted in places where a  $\langle dimension \rangle$  is required (such as in the argument of \muskip\_eval:n).

**TEXhackers note:** \muskip\_use:N is the TEX primitive \the: this is one of several LATEX3 names for this primitive.

#### 21 Viewing muskip variables

\muskip\_show:N

\muskip\_show:N \langle muskip \rangle

\muskip\_show:c

Displays the value of the  $\langle muskip \rangle$  on the terminal.

\muskip\_show:n

\muskip\_show:n {\muskip expression}}

New: 2011-11-22 Updated: 2015-08-07 Displays the result of evaluating the  $\langle muskip \ expression \rangle$  on the terminal.

# 22 Constant muskips

\c\_max\_muskip

The maximum value that can be stored as a muskip, with no stretch nor shrink component.

\c\_zero\_muskip

A zero length as a muskip, with no stretch nor shrink component.

## 23 Scratch muskips

\l\_tmpa\_muskip \l\_tmpb\_muskip Scratch muskip for local assignment. These are never used by the kernel code, and so are safe for use with any LATEX3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.

\g\_tmpa\_muskip \g\_tmpb\_muskip

Scratch muskip for global assignment. These are never used by the kernel code, and so are safe for use with any LaTeX3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.

#### 24 Primitive conditional

\if\_dim:w

```
\label{eq:condition} $$ \left\langle \text{if\_dim:w} \left\langle \text{dimen}_1 \right\rangle \left\langle \text{relation} \right\rangle \left\langle \text{dimen}_2 \right\rangle $$ $$ \left\langle \text{true code} \right\rangle $$ $$ \left\langle \text{false} \right\rangle $$ $$ $
```

Compare two dimensions. The  $\langle relation \rangle$  is one of  $\langle , = \text{ or } \rangle$  with category code 12.

TEXhackers note: This is the TEX primitive \ifdim.

#### 25 Internal functions

\\_\_dim\_eval:w
\\_\_dim\_eval\_end:

```
\verb|\__dim_eval:w| \langle \textit{dimexpr}\rangle \ \verb|\__dim_eval_end:|
```

Evaluates \( \)dim\_eval:n. The evaluation stops when an unexpandable token which is not a valid part of a dimension is read or when \\_-dim\_eval\_end: is reached. The latter is gobbled by the scanner mechanism: \\_\_dim\_-eval\_end: itself is unexpandable but used correctly the entire construct is expandable.

**TEXhackers note:** This is the  $\varepsilon$ -TEX primitive \dimexpr.

#### Part XI

# The **I3tl** package Token lists

TEX works with tokens, and LATEX3 therefore provides a number of functions to deal with lists of tokens. Token lists may be present directly in the argument to a function:

```
\foo:n { a collection of \tokens }
```

or may be stored in a so-called "token list variable", which have the suffix t1: a token list variable can also be used as the argument to a function, for example

```
\foo:N \l_some_tl
```

In both cases, functions are available to test an manipulate the lists of tokens, and these have the module prefix t1. In many cases, function which can be applied to token list variables are paired with similar functions for application to explicit lists of tokens: the two "views" of a token list are therefore collected together here.

A token list (explicit, or stored in a variable) can be seen either as a list of "items", or a list of "tokens". An item is whatever  $\use:n$  would grab as its argument: a single non-space token or a brace group, with optional leading explicit space characters (each item is thus itself a token list). A token is either a normal N argument, or  $\sqcup$ ,  $\{$ , or  $\}$  (assuming normal TeX category codes). Thus for example

```
{ Hello } ~ world
```

contains six items (Hello, w, o, r, 1 and d), but thirteen tokens ( $\{$ , H, e, 1, 1, o,  $\}$ ,  $\sqcup$ , w, o, r, 1 and d). Functions which act on items are often faster than their analogue acting directly on tokens.

**TEX** hackers note: When TEX fetches an undelimited argument from the input stream, explicit character tokens with character code 32 (space) and category code 10 (space), which we here call "explicit space characters", are ignored. If the following token is an explicit character token with category code 1 (begin-group) and an arbitrary character code, then TEX scans ahead to obtain an equal number of explicit character tokens with category code 1 (begin-group) and 2 (end-group), and the resulting list of tokens (with outer braces removed) becomes the argument. Otherwise, a single token is taken as the argument for the macro: we call such single tokens "N-type", as they are suitable to be used as an argument for a function with the signature: N.

When TEX reads a character of category code 10 for the first time, it is converted to an explicit space character, with character code 32, regardless of the initial character code. "Funny" spaces with a different category code, can be produced using \tex\_lowercase:D or \tex\_uppercase:D. Explicit space characters are also produced as a result of \token\_to\_str:N, \tl\_to\_str:n, etc.

# 1 Creating and initialising token list variables

\tl\_new:N  $\t! new:N \langle tl var \rangle$ \tl\_new:c Creates a new  $\langle tl \ var \rangle$  or raises an error if the name is already taken. The declaration is global. The  $\langle tl \ var \rangle$  will initially be empty. \tl\_const:Nn  $\t! const:Nn \langle tl var \rangle \{\langle token list \rangle\}$ \tl\_const:(Nx|cn|cx) Creates a new constant  $\langle tl \ var \rangle$  or raises an error if the name is already taken. The value of the  $\langle tl \ var \rangle$  will be set globally to the  $\langle token \ list \rangle$ . \tl\_clear:N \tl\_clear:N \langle tl var \rangle \tl\_clear:c Clears all entries from the  $\langle tl \ var \rangle$ . \tl\_gclear:N \tl\_gclear:c \tl\_clear\_new:N \tl\_clear\_new:N \( t1 \ var \) \tl\_clear\_new:c Ensures that the  $\langle tl \ var \rangle$  exists globally by applying  $tl_new:N$  if necessary, then applies \tl\_gclear\_new:N  $\t_{g}$  clear: N to leave the  $\langle tl \ var \rangle$  empty. \tl\_gclear\_new:c  $\t_set_eq:NN \langle tl var_1 \rangle \langle tl var_2 \rangle$ \tl\_set\_eq:NN \tl\_set\_eq:(cN|Nc|cc) Sets the content of  $\langle tl \ var_1 \rangle$  equal to that of  $\langle tl \ var_2 \rangle$ . \tl\_gset\_eq:NN \tl\_gset\_eq:(cN|Nc|cc)  $\t_{concat:NNN} \langle t1 \ var_1 \rangle \langle t1 \ var_2 \rangle \langle t1 \ var_3 \rangle$ \tl\_concat:NNN \tl\_concat:ccc Concatenates the content of  $\langle tl \ var_2 \rangle$  and  $\langle tl \ var_3 \rangle$  together and saves the result in \tl\_gconcat:NNN  $\langle tl \ var_1 \rangle$ . The  $\langle tl \ var_2 \rangle$  will be placed at the left side of the new token list. \tl\_gconcat:ccc New: 2012-05-18 \tl\_if\_exist\_p:N ★ \tl\_if\_exist\_p:N \langle t1 var \rangle \tl\_if\_exist\_p:c  $\t_i_{exist:NTF} \langle tl \ var \rangle \ \{\langle true \ code \rangle\} \ \{\langle false \ code \rangle\}$ \tl\_if\_exist:NTF Tests whether the  $\langle tl \ var \rangle$  is currently defined. This does not check that the  $\langle tl \ var \rangle$ \tl\_if\_exist:cTF really is a token list variable. New: 2012-03-03

### 2 Adding data to token list variables

Sets  $\langle tl \ var \rangle$  to contain  $\langle tokens \rangle$ , removing any previous content from the variable.

Appends  $\langle tokens \rangle$  to the left side of the current content of  $\langle tl \ var \rangle$ .

\tl\_put\_right:Nn \tl\_put\_right:Nn \tl\_put\_right:Nn \tl\_put\_right:Nn \tl\_put\_right:Nn \tl\_put\_right:Nn \tl\_gput\_right:Nn \tl\_gput\_right:(NV|No|Nx|cn|cV|co|cx)

Appends  $\langle tokens \rangle$  to the right side of the current content of  $\langle tl \ var \rangle$ .

### 3 Modifying token list variables

\tl\_replace\_once:Nnn
\tl\_replace\_once:cnn
\tl\_greplace\_once:Nnn
\tl\_greplace\_once:cnn

 $\verb|\tl_replace_once:Nnn| \langle tl var \rangle \ \{ \langle old \ tokens \rangle \} \ \{ \langle new \ tokens \rangle \}$ 

Replaces the first (leftmost) occurrence of  $\langle old\ tokens \rangle$  in the  $\langle tl\ var \rangle$  with  $\langle new\ tokens \rangle$ .  $\langle Old\ tokens \rangle$  cannot contain  $\{$ ,  $\}$  or # (more precisely, explicit character tokens with category code 1 (begin-group) or 2 (end-group), and tokens with category code 6).

\tl\_replace\_all:Nnn
\tl\_replace\_all:cnn
\tl\_greplace\_all:Nnn
\tl\_greplace\_all:cnn

 $\t_replace_all:Nnn \langle tl var \rangle \{\langle old tokens \rangle\} \{\langle new tokens \rangle\}$ 

Replaces all occurrences of  $\langle old\ tokens \rangle$  in the  $\langle tl\ var \rangle$  with  $\langle new\ tokens \rangle$ .  $\langle Old\ tokens \rangle$  cannot contain  $\{$ ,  $\}$  or # (more precisely, explicit character tokens with category code 1 (begin-group) or 2 (end-group), and tokens with category code 6). As this function operates from left to right, the pattern  $\langle old\ tokens \rangle$  may remain after the replacement (see  $\t1_remove_all:Nn$  for an example).

Updated: 2011-08-11

Updated: 2011-08-11

\tl\_remove\_once:Nn
\tl\_remove\_once:cn
\tl\_gremove\_once:Nn
\tl\_gremove\_once:cn

 $\verb|\tl_remove_once:Nn| \langle tl| var \rangle | \{\langle tokens \rangle\}|$ 

Removes the first (leftmost) occurrence of  $\langle tokens \rangle$  from the  $\langle tl\ var \rangle$ .  $\langle Tokens \rangle$  cannot contain  $\{$ ,  $\}$  or # (more precisely, explicit character tokens with category code 1 (begingroup) or 2 (end-group), and tokens with category code 6).

Updated: 2011-08-11

```
\tl_remove_all:Nn
\tl_remove_all:cn
\tl_gremove_all:Nn
\tl_gremove_all:cn
```

Updated: 2011-08-11

```
\t! remove_all:Nn \langle tl \ var \rangle \ \{\langle tokens \rangle\}
```

Removes all occurrences of  $\langle tokens \rangle$  from the  $\langle tl \ var \rangle$ .  $\langle Tokens \rangle$  cannot contain  $\{$ ,  $\}$  or # (more precisely, explicit character tokens with category code 1 (begin-group) or 2 (end-group), and tokens with category code 6). As this function operates from left to right, the pattern  $\langle tokens \rangle$  may remain after the removal, for instance,

```
\tl_set:Nn \l_tmpa_tl {abbccd} \tl_remove_all:Nn \l_tmpa_tl {bc}
will result in \l_tmpa_tl containing abcd.
```

### 4 Reassigning token list category codes

These functions allow the rescanning of tokens: re-apply TEX's tokenization process to apply category codes different from those in force when the tokens were absorbed. Whilst this functionality is supported, it is often preferable to find alternative approaches to achieving outcomes rather than rescanning tokens (for example construction of token lists token-by-token with intervening category code changes).

```
\tl_set_rescan:Nnn \tl_set_rescan:Nnn \tl_var\) {\langle tup\} {\langle tokens\}}
\tl_set_rescan:(Nno|Nnx|cnn|cno|cnx)
\tl_gset_rescan:(Nno|Nnx|cnn|cno|cnx)

Ubdated: 2015-08-11
```

Sets  $\langle tl\,var\rangle$  to contain  $\langle tokens\rangle$ , applying the category code régime specified in the  $\langle setup\rangle$  before carrying out the assignment. (Category codes applied to tokens not explicitly covered by the  $\langle setup\rangle$  will be those in force at the point of use of  $\texttt{tl_set_rescan:Nnn.}$ ) This allows the  $\langle tl\,var\rangle$  to contain material with category codes other than those that apply when  $\langle tokens\rangle$  are absorbed. The  $\langle setup\rangle$  is run within a group and may contain any valid input, although only changes in category codes are relevant. See also  $\texttt{tl_-rescan:nn.}$ 

**TEXhackers note:** The  $\langle tokens \rangle$  are first turned into a string (using \tl\_to\_str:n). If the string contains one or more characters with character code \newlinechar (set equal to \endlinechar unless that is equal to 32, before the user  $\langle setup \rangle$ ), then it is split into lines at these characters, then read as if reading multiple lines from a file, ignoring spaces (catcode 10) at the beginning and spaces and tabs (character code 32 or 9) at the end of every line. Otherwise, spaces (and tabs) are retained at both ends of the single-line string, as if it appeared in the middle of a line read from a file. Only the case of a single line is supported in LuaTeX because of a bug in this engine.

```
\tl_rescan:nn
```

```
\t_{rescan:nn} {\langle setup \rangle} {\langle tokens \rangle}
```

Updated: 2015-08-11

Updated: 2012-06-05

Rescans  $\langle tokens \rangle$  applying the category code régime specified in the  $\langle setup \rangle$ , and leaves the resulting tokens in the input stream. (Category codes applied to tokens not explicitly covered by the  $\langle setup \rangle$  will be those in force at the point of use of  $\texttt{tl_rescan:nn.}$ ) The  $\langle setup \rangle$  is run within a group and may contain any valid input, although only changes in category codes are relevant. See also  $\texttt{tl_set_rescan:Nnn}$ , which is more robust than using  $\texttt{tl_set:Nn}$  in the  $\langle tokens \rangle$  argument of  $\texttt{tl_rescan:nn.}$ 

**TEXhackers note:** The  $\langle tokens \rangle$  are first turned into a string (using \tl\_to\_str:n). If the string contains one or more characters with character code \newlinechar (set equal to \endlinechar unless that is equal to 32, before the user  $\langle setup \rangle$ ), then it is split into lines at these characters, then read as if reading multiple lines from a file, ignoring spaces (catcode 10) at the beginning and spaces and tabs (character code 32 or 9) at the end of every line. Otherwise, spaces (and tabs) are retained at both ends of the single-line string, as if it appeared in the middle of a line read from a file. Only the case of a single line is supported in LuaTeX because of a bug in this engine.

#### 5 Token list conditionals

```
\tilde{c} = \tilde{c} \cdot 
\tl_if_blank_p:n
                                                                                                                                                                                                                                                \tilde{\zeta} = \tilde{\zeta}  {\zeta = \tilde{\zeta} \in \mathcal{L}}
 \tl_if_blank_p:(V|o)
 \tl_if_blank:nTF
                                                                                                                                                                                                                                                Tests if the \langle token \ list \rangle consists only of blank spaces (i.e. contains no item). The test is
 \tl_if_blank:(V|o)TF
                                                                                                                                                                                                                                                true if \langle token \ list \rangle is zero or more explicit space characters (explicit tokens with character
                                                                                                                                                                                                                                                code 32 and category code 10), and is false otherwise.
                              \tl_if_empty_p:N
                                                                                                                                                                                                                                                \tl_if_empty_p:N \( t1 \ var \)
                                                                                                                                                                                                                                                  \tilde{c} = \int_{\mathbb{R}^n} \left\{ \langle true \ code \rangle \right\} \left\{ \langle false \ code \rangle \right\}
                                \tl_if_empty_p:c
                                \tl_if_empty:NTF
                                                                                                                                                                                                                                                  Tests if the \langle token\ list\ variable \rangle is entirely empty (i.e. contains no tokens at all).
                                \tl_if_empty:cTF
                                                                                                                                                                                                                                                  \tilde{tl_if_empty_p:n} \{\langle token\ list \rangle\}
\tl_if_empty_p:n
                                                                                                                                                                                                                                                  \tilde{\zeta} = \frac{1}{2} \left(\frac{1}{2} - \frac{1}{2} \left(\frac{1}{2} - \frac{1}{2} - \frac{1}{2}
 \tl_if_empty_p:(V|o)
 \tl_if_empty:nTF
                                                                                                                                                                                                                                                  Tests if the \langle token \ list \rangle is entirely empty (i.e. contains no tokens at all).
 \t: (V|o)TF
                                                                                                      New: 2012-05-24
```

```
\label{eq:continuous_problem} $$ \begin{array}{ll} \label{eq:continuous_problem} $$ \begin{array}{ll} \label{eq:continuous_problem} \label{eq:continuous_problem} \label{eq:continuous_problem} \label{eq:continuous_problem} $$ \begin{array}{ll} \label{eq:continuous_problem} \label{eq:continuous_problem} \label{eq:continuous_problem} \label{eq:continuous_problem} \label{eq:continuous_problem} \label{eq:continuous_problem} $$ \begin{array}{ll} \label{eq:continuous_problem} \label{eq:continuous_problem
```

Compares the content of two  $\langle token\ list\ variables \rangle$  and is logically true if the two contain the same list of tokens (i.e. identical in both the list of characters they contain and the category codes of those characters). Thus for example

```
\tl_set:Nn \l_tmpa_tl { abc }
\tl_set:Nx \l_tmpb_tl { \tl_to_str:n { abc } }
\tl_if_eq:NNTF \l_tmpa_tl \l_tmpb_tl { true } { false }
```

yields false.

\tl\_if\_eq:nnTF

```
\label{token_list_2} $$ \tilde{\varphi}: \inf_{eq:nnTF} {\langle token\ list_1 \rangle} {\langle token\ list_2 \rangle} {\langle true\ code \rangle} {\langle false\ code \rangle} $$
```

Tests if  $\langle token \ list_1 \rangle$  and  $\langle token \ list_2 \rangle$  contain the same list of tokens, both in respect of character codes and category codes.

\tl\_if\_in:Nn<u>TF</u> \tl\_if\_in:cn<u>TF</u>

```
\label{limin} $$ \tilde{\iota}:NnTF \ \langle tl \ var \rangle \ \{\langle token \ list \rangle\} \ \{\langle true \ code \rangle\} \ \{\langle false \ code \rangle\} $$
```

Tests if the  $\langle token \ list \rangle$  is found in the content of the  $\langle tl \ var \rangle$ . The  $\langle token \ list \rangle$  cannot contain the tokens  $\{,\}$  or # (more precisely, explicit character tokens with category code 1 (begin-group) or 2 (end-group), and tokens with category code 6).

$$\label{eq:tl_if_in:nn} $$ \begin{split} & \text{$tl_if_in:nn$} & \text{$TF$} \\ & \text{$tl_if_in:(Vn|on|no)$} & \text{$TF$} \end{split} $$$$

```
\tl_if_in:nnTF {\langle token \ list_1 \rangle} {\langle token \ list_2 \rangle} {\langle true \ code \rangle} {\langle false \ code \rangle}
```

Tests if  $\langle token \ list_2 \rangle$  is found inside  $\langle token \ list_1 \rangle$ . The  $\langle token \ list_2 \rangle$  cannot contain the tokens  $\{,\}$  or # (more precisely, explicit character tokens with category code 1 (begingroup) or 2 (end-group), and tokens with category code 6).

```
\tl_if_single_p:N *
\tl_if_single_p:c *
\tl_if_single:N<u>TF</u> *
\tl_if_single:c<u>TF</u> *
```

```
\t1_if_single_p: N \ \langle tl \ var \rangle \\ \t1_if_single: NTF \ \langle tl \ var \rangle \ \{\langle true \ code \rangle\} \ \{\langle false \ code \rangle\}
```

Tests if the content of the  $\langle tl \ var \rangle$  consists of a single item, *i.e.* is a single normal token (neither an explicit space character nor a begin-group character) or a single brace group, surrounded by optional spaces on both sides. In other words, such a token list has token count 1 according to  $\t=0.11$ .

```
\tl_if_single_p:n >
```

\tl\_if\_single:nTF

```
$$ \tilde{\sigma}_single_p:n {\langle token \ list\rangle} $$ \tilde{\sigma}_single:nTF {\langle token \ list\rangle} {\langle true \ code\rangle} {\langle false \ code\rangle} $$
```

Updated: 2011-08-13

Updated: 2011-08-13

Tests if the  $\langle token\ list \rangle$  has exactly one item, *i.e.* is a single normal token (neither an explicit space character nor a begin-group character) or a single brace group, surrounded by optional spaces on both sides. In other words, such a token list has token count 1 according to  $\t1_count:n$ .

 $\{\langle false\ code \rangle\}$ 

This function compares the  $\langle test\ token\ list\ variable \rangle$  in turn with each of the  $\langle token\ list\ variable\ cases \rangle$ . If the two are equal (as described for \tl\_if\_eq:NNTF) then the associated  $\langle code \rangle$  is left in the input stream. If any of the cases are matched, the  $\langle true\ code \rangle$  is also inserted into the input stream (after the code for the appropriate case), while if none match then the  $\langle false\ code \rangle$  is inserted. The function \tl\_case:Nn, which does nothing if there is no match, is also available.

# 6 Mapping to token lists

\tl\_map\_function:NN ☆ \tl\_map\_function:cN ☆

 $\t \sum_{map\_function:NN} \langle tl \ var \rangle \ \langle function \rangle$ 

Updated: 2012-06-29

Applies  $\langle function \rangle$  to every  $\langle item \rangle$  in the  $\langle tl\ var \rangle$ . The  $\langle function \rangle$  will receive one argument for each iteration. This may be a number of tokens if the  $\langle item \rangle$  was stored within braces. Hence the  $\langle function \rangle$  should anticipate receiving n-type arguments. See also  $tl_map_function:nN$ .

\tl\_map\_function:nN \( \phi \)

\tl\_map\_break:

\tl\_map\_break:

Updated: 2012-06-29

Used to terminate a  $\t1_map...$  function before all entries in the  $\langle token\ list\ variable \rangle$  have been processed. This will normally take place within a conditional statement, for example

```
\tl_map_inline:Nn \l_my_tl
{
   \str_if_eq:nnT { #1 } { bingo } { \tl_map_break: }
   % Do something useful
}
```

See also \tl\_map\_break:n. Use outside of a \tl\_map\_... scenario will lead to low level TeX errors.

**TEXhackers note:** When the mapping is broken, additional tokens may be inserted by the internal macro  $\_prg_break_point:Nn$  before the  $\langle tokens \rangle$  are inserted into the input stream. This will depend on the design of the mapping function.

\tl\_map\_break:n ☆

 $\tilde{\langle tokens \rangle}$ 

Updated: 2012-06-29

Used to terminate a  $\t_{map...}$  function before all entries in the  $\langle token \ list \ variable \rangle$  have been processed, inserting the  $\langle tokens \rangle$  after the mapping has ended. This will normally take place within a conditional statement, for example

Use outside of a \tl\_map\_... scenario will lead to low level TEX errors.

**TEXhackers note:** When the mapping is broken, additional tokens may be inserted by the internal macro  $\protect\operatorname{\sc map}$  break\_point: Nn before the  $\langle tokens \rangle$  are inserted into the input stream. This will depend on the design of the mapping function.

## 7 Using token lists

\tl\_to\_str:n ★

\tl\_to\_str:n {\langle token list \rangle}

Converts the  $\langle token \ list \rangle$  to a  $\langle string \rangle$ , leaving the resulting character tokens in the input stream. A  $\langle string \rangle$  is a series of tokens with category code 12 (other) with the exception of spaces, which retain category code 10 (space).

**TEXhackers note:** Converting a  $\langle token\ list \rangle$  to a  $\langle string \rangle$  yields a concatenation of the string representations of every token in the  $\langle token\ list \rangle$ . The string representation of a control sequence is

- an escape character, whose character code is given by the internal parameter \escapechar, absent if the \escapechar is negative or greater than the largest character code;
- the control sequence name, as defined by \cs\_to\_str:N;
- a space, unless the control sequence name is a single character whose category at the time of expansion of \tl\_to\_str:n is not "letter".

The string representation of an explicit character token is that character, doubled in the case of (explicit) macro parameter characters (normally #). In particular, the string representation of a token list may depend on the category codes in effect when it is evaluated, and the value of the \escapechar: for instance \tl\_to\_str:n {\a} normally produces the three character "backslash", "lower-case a", "space", but it may also produce a single "lower-case a" if the escape character is negative and a is currently not a letter.

\tl\_to\_str:N >
\tl\_to\_str:c >

\tl\_to\_str:N \langle tl var \rangle

Converts the content of the  $\langle tl \ var \rangle$  into a series of characters with category code 12 (other) with the exception of spaces, which retain category code 10 (space). This  $\langle string \rangle$  is then left in the input stream. For low-level details, see the notes given for  $\t_t_{to}$ -str:n.

\tl\_use:N \*
\tl\_use:c \*

\tl\_use:N \( t1 var \)

Recovers the content of a  $\langle tl \ var \rangle$  and places it directly in the input stream. An error will be raised if the variable does not exist or if it is invalid. Note that it is possible to use a  $\langle tl \ var \rangle$  directly without an accessor function.

# 8 Working with the content of token lists

\tl\_count:n \*
\tl\_count:(V|o) \*

New: 2012-05-13

 $\t: \{\langle tokens \rangle\}$ 

Counts the number of  $\langle items \rangle$  in  $\langle tokens \rangle$  and leaves this information in the input stream. Unbraced tokens count as one element as do each token group ( $\{...\}$ ). This process will ignore any unprotected spaces within  $\langle tokens \rangle$ . See also  $\t_count:N$ . This function requires three expansions, giving an  $\langle integer\ denotation \rangle$ .

\tl\_count:N \*
\tl\_count:c \*

 $\t! count:N \langle tl var \rangle$ 

New: 2012-05-13

Counts the number of token groups in the  $\langle tl \ var \rangle$  and leaves this information in the input stream. Unbraced tokens count as one element as do each token group ( $\{...\}$ ). This process will ignore any unprotected spaces within the  $\langle tl \ var \rangle$ . See also  $\t_{count:n}$ . This function requires three expansions, giving an  $\langle integer \ denotation \rangle$ .

\tl\_reverse:n \*
\tl\_reverse:(V|o) \*

 $\t!$ reverse:n { $\langle token \ list \rangle$ }

Updated: 2012-01-08

Reverses the order of the  $\langle items \rangle$  in the  $\langle token \ list \rangle$ , so that  $\langle item_1 \rangle \langle item_2 \rangle \langle item_3 \rangle \dots \langle item_n \rangle$  becomes  $\langle item_n \rangle \dots \langle item_3 \rangle \langle item_2 \rangle \langle item_1 \rangle$ . This process will preserve unprotected space within the  $\langle token \ list \rangle$ . Tokens are not reversed within braced token groups, which keep their outer set of braces. In situations where performance is important, consider  $\t l_reverse_items:n$ . See also  $\t l_reverse:N$ .

**TEXhackers note:** The result is returned within \unexpanded, which means that the token list will not expand further when appearing in an x-type argument expansion.

\tl\_reverse:N
\tl\_reverse:c
\tl\_greverse:N
\tl\_greverse:N

\tl\_reverse:N \langle tl var \rangle

Updated: 2012-01-08

Reverses the order of the  $\langle items \rangle$  stored in  $\langle tl \ var \rangle$ , so that  $\langle item_1 \rangle \langle item_2 \rangle \langle item_3 \rangle \dots \langle item_n \rangle$  becomes  $\langle item_n \rangle \dots \langle item_3 \rangle \langle item_2 \rangle \langle item_1 \rangle$ . This process will preserve unprotected spaces within the  $\langle token \ list \ variable \rangle$ . Braced token groups are copied without reversing the order of tokens, but keep the outer set of braces. See also \tl\_reverse:n, and, for improved performance, \tl reverse items:n.

\tl\_reverse\_items:n \*

 $tl_reverse_items:n {\langle token \ list \rangle}$ 

New: 2012-01-08

Reverses the order of the  $\langle items \rangle$  stored in  $\langle tl\ var \rangle$ , so that  $\{\langle item_1 \rangle\} \{\langle item_2 \rangle\} \{\langle item_3 \rangle\} \}$  ...  $\{\langle item_1 \rangle\} \{\langle item_1 \rangle\} \}$  This process will remove any unprotected space within the  $\langle token\ list \rangle$ . Braced token groups are copied without reversing the order of tokens, and keep the outer set of braces. Items which are initially not braced are copied with braces in the result. In cases where preserving spaces is important, consider the slower function  $\t l_reverse:n$ .

**T**<sub>E</sub>**X**hackers note: The result is returned within \unexpanded, which means that the token list will not expand further when appearing in an x-type argument expansion.

\tl\_trim\_spaces:n \*

 $\t!$  tl\_trim\_spaces:n { $\langle token \ list \rangle$ }

New: 2011-07-09 Updated: 2012-06-25 Removes any leading and trailing explicit space characters (explicit tokens with character code 32 and category code 10) from the  $\langle token\ list \rangle$  and leaves the result in the input stream.

**TEXhackers note:** The result is returned within \unexpanded, which means that the token list will not expand further when appearing in an x-type argument expansion.

```
\tl_trim_spaces:N
\tl_trim_spaces:c
\tl_gtrim_spaces:N
\tl_gtrim_spaces:c
```

New: 2011-07-09

```
\tl_trim_spaces:N \langle tl var \rangle
```

Removes any leading and trailing explicit space characters (explicit tokens with character code 32 and category code 10) from the content of the  $\langle tl \ var \rangle$ . Note that this therefore resets the content of the variable.

# 9 The first token from a token list

Functions which deal with either only the very first item (balanced text or single normal token) in a token list, or the remaining tokens.

```
\tilde{\langle token\ list \rangle}
```

Leaves in the input stream the first  $\langle item \rangle$  in the  $\langle token \ list \rangle$ , discarding the rest of the  $\langle token \ list \rangle$ . All leading explicit space characters (explicit tokens with character code 32 and category code 10) are discarded; for example

```
\tl_head:n { abc }
\tl head:n { ~ abc }
```

and

will both leave **a** in the input stream. If the "head" is a brace group, rather than a single token, the braces will be removed, and so

```
\tl_head:n { ~ { ~ ab } c }
```

yields  $\_$ ab. A blank  $\langle token \ list \rangle$  (see  $\tl_if_blank:nTF$ ) will result in  $\tl_head:n$  leaving nothing in the input stream.

**T**<sub>E</sub>**X**hackers note: The result is returned within \exp\_not:n, which means that the token list will not expand further when appearing in an x-type argument expansion.

```
\tl_head:w *
```

```
\tl_head:w \( token list \) \ \q_stop
```

Leaves in the input stream the first  $\langle item \rangle$  in the  $\langle token \ list \rangle$ , discarding the rest of the  $\langle token \ list \rangle$ . All leading explicit space characters (explicit tokens with character code 32 and category code 10) are discarded. A blank  $\langle token \ list \rangle$  (which consists only of space characters) will result in a low-level TeX error, which may be avoided by the inclusion of an empty group in the input (as shown), without the need for an explicit test. Alternatively,  $\tl_if_blank:nF$  may be used to avoid using the function with a "blank" argument. This function requires only a single expansion, and thus is suitable for use within an o-type expansion. In general,  $\tl_head:n$  should be preferred if the number of expansions is not critical.

```
\t! \t! \{ \langle token \ list \rangle \}
```

and

Discards all leading explicit space characters (explicit tokens with character code 32 and category code 10) and the first  $\langle item \rangle$  in the  $\langle token\ list \rangle$ , and leaves the remaining tokens in the input stream. Thus for example

```
\tl_tail:n { a ~ {bc} d }
```

\tl tail:n { ~ a ~ {bc} d }

will both leave  $\sqcup \{bc\}d$  in the input stream. A blank  $\langle token \ list \rangle$  (see  $\tl_if_blank:nTF$ ) will result in  $\tl_tail:n$  leaving nothing in the input stream.

**TEXhackers note:** The result is returned within \exp\_not:n, which means that the token list will not expand further when appearing in an x-type argument expansion.

Tests if the first  $\langle token \rangle$  in the  $\langle token \ list \rangle$  has the same category code as the  $\langle token \rangle$ . In the case where the  $\langle token \ list \rangle$  is empty, the test will always be false.

Tests if the first  $\langle token \rangle$  in the  $\langle token \ list \rangle$  has the same character code as the  $\langle token \rangle$ . In the case where the  $\langle token \ list \rangle$  is empty, the test will always be false.

Tests if the first  $\langle token \rangle$  in the  $\langle token | list \rangle$  has the same meaning as the  $\langle test | token \rangle$ . In the case where  $\langle token | list \rangle$  is empty, the test will always be false.

```
\tl_if_head_is_group_p:n *
\tl_if_head_is_group:nTF *
```

```
\label{token list} $$ \tilde{f}_{\hat{s}_{ode}}:nTF {\langle token \ list \rangle} $$ \tilde{f}_{\hat{s}_{ode}} = \tilde{f}_{\hat{s}_{ode}}. $$
```

New: 2012-07-08

Tests if the first  $\langle token \rangle$  in the  $\langle token | list \rangle$  is an explicit begin-group character (with category code 1 and any character code), in other words, if the  $\langle token | list \rangle$  starts with a brace group. In particular, the test is false if the  $\langle token | list \rangle$  starts with an implicit token such as  $\c_group\_begin\_token$ , or if it is empty. This function is useful to implement actions on token lists on a token by token basis.

Tests if the first  $\langle token \rangle$  in the  $\langle token | list \rangle$  is a normal N-type argument. In other words, it is neither an explicit space character (explicit token with character code 32 and category code 10) nor an explicit begin-group character (with category code 1 and any character code). An empty argument yields false, as it does not have a "normal" first token. This function is useful to implement actions on token lists on a token by token basis.

```
\tl_if_head_is_space_p:n *
\tl_if_head_is_space:nTF *
```

```
$$ \begin{split} & \tilde{s}_{p:n} & (token \ list) \\ & \tilde{s}_{p:n} & (token \ list) \\ & (true \ code) \\ & (false \ code) \\ \end{aligned}
```

Updated: 2012-07-08

Tests if the first  $\langle token \rangle$  in the  $\langle token \ list \rangle$  is an explicit space character (explicit token with character code 12 and category code 10). In particular, the test is false if the  $\langle token \ list \rangle$  starts with an implicit token such as  $\c_space_token$ , or if it is empty. This function is useful to implement actions on token lists on a token by token basis.

## 10 Using a single item

Indexing items in the  $\langle token \ list \rangle$  from 1 on the left, this function will evaluate the  $\langle integer \ expression \rangle$  and leave the appropriate item from the  $\langle token \ list \rangle$  in the input stream. If the  $\langle integer \ expression \rangle$  is negative, indexing occurs from the right of the token list, starting at -1 for the right-most item. If the index is out of bounds, then thr function expands to nothing.

**TEXhackers note:** The result is returned within the \unexpanded primitive (\exp\_not:n), which means that the  $\langle item \rangle$  will not expand further when appearing in an x-type argument expansion.

# 11 Viewing token lists

\tl\_show:N
\tl\_show:c

 $\t! \ \langle tl\_show: N \ \langle tl \ var \rangle$ 

Updated: 2015-08-01

Displays the content of the  $\langle tl \ var \rangle$  on the terminal.

**TEXhackers note:** This is similar to the TEX primitive \show, wrapped to a fixed number of characters per line.

\tl\_show:n

\tl\_show:n \token list \

Updated: 2015-08-07

Displays the  $\langle token \ list \rangle$  on the terminal.

**TEXhackers note:** This is similar to the  $\varepsilon$ -TEX primitive \showtokens, wrapped to a fixed number of characters per line.

#### 12 Constant token lists

\c\_empty\_tl

Constant that is always empty.

\c\_space\_tl

An explicit space character contained in a token list (compare this with \c\_space\_token). For use where an explicit space is required.

#### 13 Scratch token lists

\l\_tmpa\_tl \l\_tmpb\_tl Scratch token lists for local assignment. These are never used by the kernel code, and so are safe for use with any LATEX3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.

\g\_tmpa\_tl \g\_tmpb\_tl Scratch token lists for global assignment. These are never used by the kernel code, and so are safe for use with any IATEX3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.

#### 14 Internal functions

 $\__$ tl\_trim\_spaces:nn

 $\_{tl\_trim\_spaces:nn { \q_mark \text{$\langle token list$} } {\continuation$}}$ 

This function removes all leading and trailing explicit space characters from the  $\langle token \ list \rangle$ , and expands to the  $\langle continuation \rangle$ , followed by a brace group containing \use\_none:n \q\_mark  $\langle trimmed \ token \ list \rangle$ . For instance, \t1\_trim\_spaces:n is implemented by taking the  $\langle continuation \rangle$  to be \exp\_not:o, and the o-type expansion removes the \q\_mark. This function is also used in |3clist and |3candidates.

#### Part XII

# The l3str package Strings

T<sub>E</sub>X associates each character with a category code: as such, there is no concept of a "string" as commonly understood in many other programming languages. However, there are places where we wish to manipulate token lists while in some sense "ignoring" category codes: this is done by treating token lists as strings in a T<sub>E</sub>X sense.

A T<sub>E</sub>X string (and thus an expl3 string) is a series of characters which have category code 12 ("other") with the exception of space characters which have category code 10 ("space"). Thus at a technical level, a T<sub>E</sub>X string is a token list with the appropriate category codes. In this documentation, these will simply be referred to as strings.

String variables are simply specialised token lists, but by convention should be named with the suffix ...str. Such variables should contain characters with category code 12 (other), except spaces, which have category code 10 (blank space). All the functions in this module which accept a token list argument first convert it to a string using \tl\_to\_str:n for internal processing, and will not treat a token list or the corresponding string representation differently.

Note that as string variables are a special case of token list variables the coverage of  $\str_{\ldots}$  N functions is somewhat smaller than  $\true{tl}_{\ldots}$ .

Most expandable functions in this module come in three flavours:

- \str ...: N, which expect a token list or string variable as their argument;
- \str\_...:n, taking any token list (or string) as an argument;
- \str\_...\_ignore\_spaces:n, which ignores any space encountered during the operation: these functions are typically faster than those which take care of escaping spaces appropriately.

## 1 Building strings

\str\_new:N \str\_new:c

 $\str_new:N \ \langle str \ var \rangle$ 

New: 2015-09-18

Creates a new  $\langle str \ var \rangle$  or raises an error if the name is already taken. The declaration is global. The  $\langle str \ var \rangle$  will initially be empty.

\str\_const:Nn \str\_const:(Nx|cn|cx)  $\verb|\str_const:Nn| \langle str| var \rangle | \{ \langle token| list \rangle \}|$ 

New: 2015-09-18

Creates a new constant  $\langle str \ var \rangle$  or raises an error if the name is already taken. The value of the  $\langle str \ var \rangle$  will be set globally to the  $\langle token \ list \rangle$ , converted to a string.

\str\_clear:N

\str\_clear:N \( str var \)

\str\_clear:c \str\_gclear:N

Clears the content of the  $\langle str \ var \rangle$ .

\str\_gclear:c

New: 2015-09-18

New: 2015-09-18

 $\str_clear_new:N \langle str var \rangle$ 

\str\_clear\_new:N \str\_clear\_new:c

Ensures that the  $\langle str \ var \rangle$  exists globally by applying \str\_new:N if necessary, then applies \str\_(g)clear:N to leave the  $\langle str \ var \rangle$  empty.

\str\_set\_eq:NN

 $\str_set_eq:NN \langle str var_1 \rangle \langle str var_2 \rangle$ 

\str\_set\_eq:(cN|Nc|cc) \str\_gset\_eq:NN

Sets the content of  $\langle str \ var_1 \rangle$  equal to that of  $\langle str \ var_2 \rangle$ .

\str\_gset\_eq:(cN|Nc|cc)

New: 2015-09-18

## 2 Adding data to string variables

\str\_set:Nn

 $\str_set:Nn \langle str var \rangle \{\langle token list \rangle\}$ 

\str\_set:(Nx|cn|cx) \str\_gset:Nn

Converts the  $\langle token \ list \rangle$  to a  $\langle string \rangle$ , and stores the result in  $\langle str \ var \rangle$ .

 $\str_gset:(Nx|cn|cx)$ 

New: 2015-09-18

\str\_put\_left:Nn

 $\str_put_left:Nn \langle str var \rangle \{\langle token list \rangle\}$ 

\str\_put\_left:(Nx|cn|cx) \str\_gput\_left:Nn

Converts the  $\langle token \ list \rangle$  to a  $\langle string \rangle$ , and prepends the result to  $\langle str \ var \rangle$ . The current contents of the  $\langle str \ var \rangle$  are not automatically converted to a string.

\str\_gput\_left:(Nx|cn|cx)

New: 2015-09-18

\str\_put\_right:Nn

 $\str_put_right:Nn \langle str var \rangle \{\langle token list \rangle\}$ 

\str\_put\_right:(Nx|cn|cx) \str\_gput\_right:Nn

Converts the  $\langle token \ list \rangle$  to a  $\langle string \rangle$ , and appends the result to  $\langle str \ var \rangle$ . The current contents of the  $\langle str \ var \rangle$  are not automatically converted to a string.

\str\_gput\_right:(Nx|cn|cx)

New: 2015-09-18

#### 2.1 String conditionals

```
\str_if_exist_p:N *
                                    \str_if_exist_p:N \( str var \)
                                    \str_if_exist:NTF \ \langle str \ var \rangle \ \{\langle true \ code \rangle\} \ \{\langle false \ code \rangle\}
      \str_if_exist_p:c
      \str_if_exist:NTF
                                    Tests whether the \langle str \ var \rangle is currently defined. This does not check that the \langle str \ var \rangle
      \str_if_exist:cTF *
                                    really is a string.

```

This function compares the  $\langle test\ string \rangle$  in turn with each of the  $\langle string\ cases \rangle$ . If the two are equal (as described for  $\str_if_eq:nnTF$  then the associated  $\langle code \rangle$  is left in the input stream. If any of the cases are matched, the  $\langle true\ code \rangle$  is also inserted into the input stream (after the code for the appropriate case), while if none match then the  $\langle false\ code \rangle$  is inserted. The function  $\str_case:nn$ , which does nothing if there is no match, is also available.

```

New: 2013-07-24
```

```
\str\_case\_x:nnF \ \{\langle test\ string \rangle\} \ \{ \\ \{\langle string\ case_1 \rangle\} \ \{\langle code\ case_1 \rangle\} \ \{\langle string\ case_2 \rangle\} \ \dots \\ \{\langle string\ case_n \rangle\} \ \{\langle code\ case_n \rangle\} \ \} \\ \{\langle true\ code \rangle\} \ \{\langle false\ code \rangle\} \ \}
```

# 3 Working with the content of strings

```
\str_use:N
```

 $\str\_use:N \langle str var \rangle$ 

New: 2015-09-18

Recovers the content of a  $\langle str \ var \rangle$  and places it directly in the input stream. An error will be raised if the variable does not exist or if it is invalid. Note that it is possible to use a  $\langle str \rangle$  directly without an accessor function.

Leaves in the input stream the number of characters in the string representation of  $\langle token \ list \rangle$ , as an integer denotation. The functions differ in their treatment of spaces. In the case of  $\str_count:\mathbb{N}$  and  $\str_count:\mathbb{n}$ , all characters including spaces are counted. The  $\str_count_ignore_spaces:\mathbb{n}$  function leaves the number of non-space characters in the input stream.

```
\str_count_spaces:N *\str_count_spaces:c *\str_count_spaces:n *

New: 2015-09-18
```

 $\str\_count\_spaces:n \{\langle token \ list \rangle\}$ 

Leaves in the input stream the number of space characters in the string representation of  $\langle token \ list \rangle$ , as an integer denotation. Of course, this function has no \_ignore\_spaces variant.

Converts the  $\langle token\ list \rangle$  into a  $\langle string \rangle$ . The first character in the  $\langle string \rangle$  is then left in the input stream, with category code "other". The functions differ if the first character is a space:  $\str_head:N$  and  $\str_head:n$  return a space token with category code 10 (blank space), while the  $\str_head_ignore_spaces:n$  function ignores this space character and leaves the first non-space character in the input stream. If the  $\langle string \rangle$  is empty (or only contains spaces in the case of the  $\string_spaces$ 

Converts the \( \text{token list} \) to a \( \string \), removes the first character, and leaves the remaining characters (if any) in the input stream, with category codes 12 and 10 (for spaces). The functions differ in the case where the first character is a space: \str\_tail:N and \str\_tail:n will trim only that space, while \str\_tail\_ignore\_spaces:n removes the first non-space character and any space before it. If the \( \text{token list} \) is empty (or blank in the case of the \_ignore\_spaces variant), then nothing is left on the input stream.

```
\label{limin} $$ \left( \frac{\t oken \ list}{\t oken \ list} \right) = \left( \frac{\t oken \ list}{\t oken \ list} \right) $$
```

Converts the  $\langle token\ list \rangle$  to a  $\langle string \rangle$ , and leaves in the input stream the character in position  $\langle integer\ expression \rangle$  of the  $\langle string \rangle$ , starting at 1 for the first (left-most) character. In the case of  $\str_item:Nn$  and  $\str_item:nn$ , all characters including spaces are taken into account. The  $\str_item_ignore_spaces:nn$  function skips spaces when counting characters. If the  $\langle integer\ expression \rangle$  is negative, characters are counted from the end of the  $\langle string \rangle$ . Hence, -1 is the right-most character, etc.

Converts the  $\langle token \ list \rangle$  to a  $\langle string \rangle$ , and leaves in the input stream the characters from the  $\langle start \ index \rangle$  to the  $\langle end \ index \rangle$  inclusive. Positive  $\langle indices \rangle$  are counted from the start of the string, 1 being the first character, and negative  $\langle indices \rangle$  are counted from the end of the string, -1 being the last character. If either of  $\langle start \ index \rangle$  or  $\langle end \ index \rangle$  is 0, the result is empty. For instance,

```
\iow_term:x { \str_range:nnn { abcdef } { 2 } { 5 } }
\iow_term:x { \str_range:nnn { abcdef } { -4 } { -1 } }
\iow_term:x { \str_range:nnn { abcdef } { -2 } { -1 } }
\iow_term:x { \str_range:nnn { abcdef } { 0 } { -1 } }
```

will print bcde, cdef, ef, and an empty line to the terminal. The  $\langle start\ index \rangle$  must always be smaller than or equal to the  $\langle end\ index \rangle$ : if this is not the case then no output is generated. Thus

```
\iow_term:x { \str_range:nnn { abcdef } { 5 } { 2 } }
\iow term:x { \str range:nnn { abcdef } { -1 } { -4 } }
```

both yield empty strings.

### 4 String manipulation

```
\str_lower_case:n ☆ \str_lower_case:f ☆ \str_upper_case:n ☆ \str_upper_case:f ☆ New: 2015-03-01
```

```
\str_lower_case:n {\langle tokens \rangle} 
\str_upper_case:n {\langle tokens \rangle}
```

Converts the input  $\langle tokens \rangle$  to their string representation, as described for  $\t = str:n$ , and then to the lower or upper case representation using a one-to-one mapping as described by the Unicode Consortium file UnicodeData.txt.

These functions are intended for case changing programmatic data in places where upper/lower case distinctions are meaningful. One example would be automatically generating a function name from user input where some case changing is needed. In this situation the input is programmatic, not textual, case does have meaning and a language-independent one-to-one mapping is appropriate. For example

```
\cs_new_protected:Npn \myfunc:nn #1#2
{
    \cs_set_protected:cpn
    {
        user
        \str_upper_case:f { \tl_head:n {#1} }
        \str_lower_case:f { \tl_tail:n {#1} }
    }
    { #2 }
}
```

would be used to generate a function with an auto-generated name consisting of the upper case equivalent of the supplied name followed by the lower case equivalent of the rest of the input.

These functions should *not* be used for

- Caseless comparisons: use \str\_fold\_case:n for this situation (case folding is district from lower casing).
- Case changing text for typesetting: see the \tl\_lower\_case:n(n), \tl\_upper\_case:n(n) and \tl\_mixed\_case:n(n) functions which correctly deal with context-dependence and other factors appropriate to text case changing.

TeXhackers note: As with all expl3 functions, the input supported by \str\_fold\_case:n is engine-native characters which are or interoperate with UTF-8. As such, when used with pdfTeX only the Latin alphabet characters A–Z will be case-folded (i.e. the ASCII range which coincides with UTF-8). Full UTF-8 support is available with both XqTeX and LuaTeX, subject only to the fact that XqTeX in particular has issues with characters of code above hexadecimal 0xFFFF when interacting with \tl\_to\_str:n.

```
\str_fold_case:n *
\str_fold_case:V *
```

New: 2014-06-19 Updated: 2016-03-07

```
\str_fold_case:n \{\langle tokens \rangle\}
```

Converts the input  $\langle tokens \rangle$  to their string representation, as described for  $\t _{tl_to_str:n}$ , and then folds the case of the resulting  $\langle string \rangle$  to remove case information. The result of this process is left in the input stream.

String folding is a process used for material such as identifiers rather than for "text". The folding provided by \str\_fold\_case:n follows the mappings provided by the Unicode Consortium, who state:

Case folding is primarily used for caseless comparison of text, such as identifiers in a computer program, rather than actual text transformation. Case folding in Unicode is based on the lowercase mapping, but includes additional changes to the source text to help make it language-insensitive and consistent. As a result, case-folded text should be used solely for internal processing and generally should not be stored or displayed to the end user.

The folding approach implemented by \str\_fold\_case:n follows the "full" scheme defined by the Unicode Consortium (e.g. SSfolds to SS). As case-folding is a language-insensitive process, there is no special treatment of Turkic input (i.e. I always folds to i and not to 1).

TeXhackers note: As with all expl3 functions, the input supported by \str\_fold\_case:n is engine-native characters which are or interoperate with UTF-8. As such, when used with pdfTeX only the Latin alphabet characters A–Z will be case-folded (i.e. the ASCII range which coincides with UTF-8). Full UTF-8 support is available with both XqTeX and LuaTeX, subject only to the fact that XqTeX in particular has issues with characters of code above hexadecimal 0xFFFF when interacting with \tl\_to\_str:n.

# 5 Viewing strings

\str\_show:N \str\_show:c

\str\_show:n

New: 2015-09-18

\str\_show:N \( str var \)

Displays the content of the  $\langle str \ var \rangle$  on the terminal.

#### 6 Constant token lists

\c\_ampersand\_str
\c\_atsign\_str
\c\_backslash\_str
\c\_left\_brace\_str
\c\_right\_brace\_str
\c\_circumflex\_str
\c\_colon\_str
\c\_dollar\_str
\c\_hash\_str
\c\_percent\_str
\c\_tilde\_str
\c\_underscore\_str

Constant strings, containing a single character token, with category code 12.

New: 2015-09-19

# 7 Scratch strings

\l\_tmpa\_str
\l\_tmpb\_str

Scratch strings for local assignment. These are never used by the kernel code, and so are safe for use with any LaTeX3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.

\g\_tmpa\_str \g\_tmpb\_str Scratch strings for global assignment. These are never used by the kernel code, and so are safe for use with any LATEX3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.

#### 7.1 Internal string functions

 $\_\_$ str\_if\_eq\_x:nn \*

```
\verb|\_str_if_eq_x:nn {$\langle tl_1 \rangle$} {\langle tl_2 \rangle$}
```

Compares the full expansion of two  $\langle token\ lists \rangle$  on a character by character basis, and is **true** if the two lists contain the same characters in the same order. Leaves 0 in the input stream if the condition is true, and +1 or -1 otherwise.

\\_\_str\_if\_eq\_x\_return:nn

```
\__str_if_eq_x_return:nn \{\langle tl_1 \rangle\} \{\langle tl_2 \rangle\}
```

Compares the full expansion of two  $\langle token\ lists \rangle$  on a character by character basis, and is true if the two lists contain the same characters in the same order. Either \prg\_return\_true: or \prg\_return\_false: is then left in the input stream. This is a version of \str\_if\_eq\_x:nn(TF) coded for speed.

\\_str\_to\_other:n \* \\_\_

 $\_\_str\_to\_other:n \{\langle token \ list \rangle\}$ 

Converts the  $\langle token\ list \rangle$  to a  $\langle other\ string \rangle$ , where spaces have category code "other". This function can be **f**-expanded without fear of losing a leading space, since spaces do not have category code 10 in its result. It takes a time quadratic in the character count of the string.

\\_\_str\_count:n \*

 $\_\_str\_count:n \{\langle other string \rangle\}$ 

This function expects an argument that is entirely made of characters with category "other", as produced by \\_\_str\_to\_other:n. It leaves in the input stream the number of character tokens in the \( \lambda other string \rangle \), faster than the analogous \str\_count:n function.

\\_\_str\_range:nnn \*

\\_\_str\_range:nnn  $\{\langle other\ string \rangle\}$   $\{\langle start\ index \rangle\}$   $\{\langle end\ index \rangle\}$ 

Identical to \str\_range:nnn except that the first argument is expected to be entirely made of characters with category "other", as produced by \\_\_str\_to\_other:n, and the result is also an \( \lambda \text{other string} \rangle \).

#### Part XIII

# The **I3seq** package Sequences and stacks

LATEX3 implements a "sequence" data type, which contain an ordered list of entries which may contain any  $\langle balanced\ text \rangle$ . It is possible to map functions to sequences such that the function is applied to every item in the sequence.

Sequences are also used to implement stack functions in LATEX3. This is achieved using a number of dedicated stack functions.

### 1 Creating and initialising sequences

\seq\_new:N

\seq\_new:N \langle sequence \rangle

Creates a new  $\langle sequence \rangle$  or raises an error if the name is already taken. The declaration is global. The  $\langle sequence \rangle$  will initially contain no items.

\seq\_clear:N
\seq\_clear:c
\seq\_gclear:N

\seq\_gclear:c

\seq\_clear:N \langle sequence \rangle

Clears all items from the  $\langle sequence \rangle$ .

\seq\_clear\_new:N

\seq\_clear\_new:N \( \sequence \)

\seq\_gclear\_new:N

Ensures that the  $\langle sequence \rangle$  exists globally by applying \seq\_new:N if necessary, then applies \seq\_(g)clear:N to leave the  $\langle sequence \rangle$  empty.

\seq\_set\_eq:NN
\seq\_set\_eq:(cN|Nc|cc)
\seq\_gset\_eq:NN
\seq\_gset\_eq:(cN|Nc|cc)

 $\verb|\seq_set_eq:NN| \langle sequence_1 \rangle | \langle sequence_2 \rangle|$ 

Sets the content of  $\langle sequence_1 \rangle$  equal to that of  $\langle sequence_2 \rangle$ .

\seq\_set\_from\_clist:NN
\seq\_set\_from\_clist:(cN|Nc|cc)
\seq\_set\_from\_clist:Nn
\seq\_set\_from\_clist:NN
\seq\_gset\_from\_clist:(cN|Nc|cc)
\seq\_gset\_from\_clist:Nn
\seq\_gset\_from\_clist:Nn
\seq\_gset\_from\_clist:Cn

 $\verb|\seq_set_from_clist:NN| & \langle sequence \rangle & \langle comma-list \rangle|$ 

New: 2014-07-17

Converts the data in the  $\langle comma\ list \rangle$  into a  $\langle sequence \rangle$ : the original  $\langle comma\ list \rangle$  is unchanged.

```
\seq_set_split:Nnn
\seq_set_split:NnV
\seq_gset_split:Nnn
\seq_gset_split:NnV
```

New: 2011-08-15 Updated: 2012-07-02

```
\seq_concat:NNN
\seq_concat:ccc
\seq_gconcat:NNN
\seq_gconcat:ccc
```

```
\scalebox{seq\_concat:NNN} \langle sequence_1 \rangle \langle sequence_2 \rangle \langle sequence_3 \rangle
```

Concatenates the content of  $\langle sequence_2 \rangle$  and  $\langle sequence_3 \rangle$  together and saves the result in  $\langle sequence_1 \rangle$ . The items in  $\langle sequence_2 \rangle$  will be placed at the left side of the new sequence.

```
\seq_if_exist_p:N *
\seq_if_exist_p:c *
\seq_if_exist:NTF *
\seq_if_exist:cTF *

New: 2012-03-03
```

Tests whether the  $\langle sequence \rangle$  is currently defined. This does not check that the  $\langle sequence \rangle$  really is a sequence variable.

## 2 Appending data to sequences

```
\seq_put_left:Nn \seq_put_left:Nn \seq_uence \ \{\( \) \seq_put_left:\( \) \seq_put_le
```

Appends the  $\langle item \rangle$  to the right of the  $\langle sequence \rangle$ .

# 3 Recovering items from sequences

Items can be recovered from either the left or the right of sequences. For implementation reasons, the actions at the left of the sequence are faster than those acting on the right. These functions all assign the recovered material locally, *i.e.* setting the  $\langle token \ list \ variable \rangle$  used with  $tl_set:Nn$  and  $never \ tl_gset:Nn$ .

\seq\_get\_left:NN

\seq\_get\_left:NN \( \sequence \) \( \taken list variable \)

\seq\_get\_left:cN
Updated: 2012-05-14

Stores the left-most item from a  $\langle sequence \rangle$  in the  $\langle token\ list\ variable \rangle$  without removing it from the  $\langle sequence \rangle$ . The  $\langle token\ list\ variable \rangle$  is assigned locally. If  $\langle sequence \rangle$  is empty the  $\langle token\ list\ variable \rangle$  will contain the special marker  $\neq no\_value$ .

\seq\_get\_right:NN

\seq\_get\_right:NN \( \sequence \) \( \taken list variable \)

\seq\_get\_right:cN Updated: 2012-05-19

Stores the right-most item from a  $\langle sequence \rangle$  in the  $\langle token \ list \ variable \rangle$  without removing it from the  $\langle sequence \rangle$ . The  $\langle token \ list \ variable \rangle$  is assigned locally. If  $\langle sequence \rangle$  is empty the  $\langle token \ list \ variable \rangle$  will contain the special marker  $q_no_value$ .

\seq\_pop\_left:NN \seq\_pop\_left:cN

\seq\_pop\_left:NN \( sequence \) \( \taken list variable \)

Updated: 2012-05-14

Pops the left-most item from a  $\langle sequence \rangle$  into the  $\langle token \ list \ variable \rangle$ , i.e. removes the item from the sequence and stores it in the  $\langle token \ list \ variable \rangle$ . Both of the variables are assigned locally. If  $\langle sequence \rangle$  is empty the  $\langle token \ list \ variable \rangle$  will contain the special marker  $q_no_value$ .

\seq\_gpop\_left:NN

\seq\_gpop\_left:NN \( sequence \) \( \taken list variable \)

\seq\_gpop\_left:cN

Pops the left-most item from a  $\langle sequence \rangle$  into the  $\langle token\ list\ variable \rangle$ , i.e. removes the item from the sequence and stores it in the  $\langle token\ list\ variable \rangle$ . The  $\langle sequence \rangle$  is modified globally, while the assignment of the  $\langle token\ list\ variable \rangle$  is local. If  $\langle sequence \rangle$  is empty the  $\langle token\ list\ variable \rangle$  will contain the special marker  $q_no_value$ .

Updated: 2012-05-14

\seq\_pop\_right:NN

\seq\_pop\_right:NN \( sequence \) \( \taken list variable \)

\seq\_pop\_right:cN Updated: 2012-05-19

Pops the right-most item from a  $\langle sequence \rangle$  into the  $\langle token \ list \ variable \rangle$ , *i.e.* removes the item from the sequence and stores it in the  $\langle token \ list \ variable \rangle$ . Both of the variables are assigned locally. If  $\langle sequence \rangle$  is empty the  $\langle token \ list \ variable \rangle$  will contain the special marker  $q_no_value$ .

\seq\_gpop\_right:NN \seq\_gpop\_right:cN \seq\_gpop\_right:NN \( \sequence \) \( \taken list variable \)

Updated: 2012-05-19

Pops the right-most item from a  $\langle sequence \rangle$  into the  $\langle token\ list\ variable \rangle$ , i.e. removes the item from the sequence and stores it in the  $\langle token\ list\ variable \rangle$ . The  $\langle sequence \rangle$  is modified globally, while the assignment of the  $\langle token\ list\ variable \rangle$  is local. If  $\langle sequence \rangle$  is empty the  $\langle token\ list\ variable \rangle$  will contain the special marker  $q_no_value$ .

\seq\_item:Nn \*
\seq\_item:cn \*

New: 2014-07-17

 $\seq_{item:Nn} \ \langle sequence \rangle \ \{\langle integer \ expression \rangle\}$ 

Indexing items in the  $\langle sequence \rangle$  from 1 at the top (left), this function will evaluate the  $\langle integer\ expression \rangle$  and leave the appropriate item from the sequence in the input stream. If the  $\langle integer\ expression \rangle$  is negative, indexing occurs from the bottom (right) of the sequence. When the  $\langle integer\ expression \rangle$  is larger than the number of items in the  $\langle sequence \rangle$  (as calculated by \seq\_count:N) then the function will expand to nothing.

**TEXhackers note:** The result is returned within the \unexpanded primitive (\exp\_not:n), which means that the  $\langle item \rangle$  will not expand further when appearing in an x-type argument expansion.

## 4 Recovering values from sequences with branching

The functions in this section combine tests for non-empty sequences with recovery of an item from the sequence. They offer increased readability and performance over separate testing and recovery phases.

\seq\_get\_left:NN<u>TF</u> \seq\_get\_left:cNTF

> New: 2012-05-14 Updated: 2012-05-19

 $\verb|\seq_get_left:NNTF| \langle sequence \rangle | \langle token \ list \ variable \rangle | \{\langle true \ code \rangle\} | \{\langle false \ code \rangle\} | \{\langle false \ code \rangle\} | \langle false \ code \rangle \} |$ 

If the  $\langle sequence \rangle$  is empty, leaves the  $\langle false\ code \rangle$  in the input stream. The value of the  $\langle token\ list\ variable \rangle$  is not defined in this case and should not be relied upon. If the  $\langle sequence \rangle$  is empty, leaves the  $\langle false\ code \rangle$  in the input stream. The value of the  $\langle token\ list\ variable \rangle$  is not defined in this case and should not be relied upon. If the  $\langle sequence \rangle$  is non-empty, pops the right-most item from a  $\langle sequence \rangle$  in the  $\langle token\ list\ variable \rangle$ , i.e. removes the item from a  $\langle sequence \rangle$ . Both the  $\langle sequence \rangle$  and the  $\langle token\ list\ variable \rangle$  are assigned locally.

\seq\_gpop\_right:NN<u>TF</u> \seq\_gpop\_right:cN<u>TF</u>

New: 2012-05-19

If the  $\langle sequence \rangle$  is empty, leaves the  $\langle false\ code \rangle$  in the input stream. The value of the  $\langle token\ list\ variable \rangle$  is not defined in this case and should not be relied upon. If the  $\langle sequence \rangle$  is non-empty, pops the right-most item from a  $\langle sequence \rangle$  in the  $\langle token\ list\ variable \rangle$ , i.e. removes the item from a  $\langle sequence \rangle$ . The  $\langle sequence \rangle$  is modified globally, while the  $\langle token\ list\ variable \rangle$  is assigned locally.

## 5 Modifying sequences

While sequences are normally used as ordered lists, it may be necessary to modify the content. The functions here may be used to update sequences, while retaining the order of the unaffected entries.

\seq\_remove\_duplicates:N
\seq\_remove\_duplicates:C
\seq\_gremove\_duplicates:N
\seq\_gremove\_duplicates:C

\seq\_remove\_duplicates:N \langle sequence \rangle

Removes duplicate items from the  $\langle sequence \rangle$ , leaving the left most copy of each item in the  $\langle sequence \rangle$ . The  $\langle item \rangle$  comparison takes place on a token basis, as for  $\t_i=eq:nn(TF)$ .

**T<sub>E</sub>Xhackers note:** This function iterates through every item in the  $\langle sequence \rangle$  and does a comparison with the  $\langle items \rangle$  already checked. It is therefore relatively slow with large sequences.

\seq\_remove\_all:Nn
\seq\_remove\_all:cn
\seq\_gremove\_all:Nn
\seq\_gremove\_all:cn

 $\seq_remove_all:Nn \sequence \ {\langle item \rangle}$ 

Removes every occurrence of  $\langle item \rangle$  from the  $\langle sequence \rangle$ . The  $\langle item \rangle$  comparison takes place on a token basis, as for  $\t1_if_eq:nn(TF)$ .

\seq\_reverse:N
\seq\_reverse:C
\seq\_greverse:N
\seq\_greverse:C

\seq\_reverse:N \langle sequence \rangle

Reverses the order of the items stored in the  $\langle sequence \rangle$ .

New: 2014-07-18

## 6 Sequence conditionals

Tests if the  $\langle item \rangle$  is present in the  $\langle sequence \rangle$ .

# 7 Mapping to sequences

```
\seq_map_function:NN 🌣
                                      \seq_map_function:NN \langle sequence \rangle \langle function \rangle
\seq_map_function:cN 🌣
                                      Applies \langle function \rangle to every \langle item \rangle stored in the \langle sequence \rangle. The \langle function \rangle will receive
            Updated: 2012-06-29
                                      one argument for each iteration. The \langle items \rangle are returned from left to right. The function
                                      \seq_map_inline: Nn is faster than \seq_map_function: NN for sequences with more
                                      than about 10 items. One mapping may be nested inside another.
                                      \ensuremath{\mbox{seq\_map\_inline:Nn}} \ensuremath{\mbox{\mbox{sequence}}} \{\langle \ensuremath{\mbox{inline:Nn}} \ensuremath{\mbox{\mbox{\mbox{equence}}}} \}
       \seq_map_inline:Nn
       \seq_map_inline:cn
                                      Applies \langle inline\ function \rangle to every \langle item \rangle stored within the \langle sequence \rangle. The \langle inline\ function \rangle
            Updated: 2012-06-29
                                      function should consist of code which will receive the \langle item \rangle as #1. One in line mapping
                                      can be nested inside another. The \langle items \rangle are returned from left to right.
                                                     \ensuremath{\mbox{seq\_map\_variable:NNn}} \ensuremath{\mbox{sequence}} \ensuremath{\mbox{$\langle$t1$ var.}$} \ensuremath{\mbox{$\langle$function using t1 var.}$}
    \seq_map_variable:NNn
```

Stores each entry in the  $\langle sequence \rangle$  in turn in the  $\langle tl \ var. \rangle$  and applies the  $\langle function \ using \ tl \ var. \rangle$  The  $\langle function \rangle$  will usually consist of code making use of the  $\langle tl \ var. \rangle$ , but this is not enforced. One variable mapping can be nested inside another. The  $\langle items \rangle$  are returned from left to right.

\seq\_map\_break: 🔯

\seq\_map\_break:

Updated: 2012-06-29

Used to terminate a  $\seq_map_...$  function before all entries in the  $\langle sequence \rangle$  have been processed. This will normally take place within a conditional statement, for example

Use outside of a \seq\_map\_... scenario will lead to low level TFX errors.

**TEXhackers note:** When the mapping is broken, additional tokens may be inserted by the internal macro \\_\_prg\_break\_point:Nn before further items are taken from the input stream. This will depend on the design of the mapping function.

\seq\_map\_break:n ☆

 $\verb|\seq_map_break:n {| \langle tokens \rangle|}$ 

Updated: 2012-06-29

Used to terminate a  $\seq_map_...$  function before all entries in the  $\langle sequence \rangle$  have been processed, inserting the  $\langle tokens \rangle$  after the mapping has ended. This will normally take place within a conditional statement, for example

Use outside of a \seq\_map\_... scenario will lead to low level TeX errors.

**TeXhackers note:** When the mapping is broken, additional tokens may be inserted by the internal macro  $\protect\operatorname{\sc Mn}$  before the  $\langle tokens \rangle$  are inserted into the input stream. This will depend on the design of the mapping function.

\seq\_count:N \*
\seq\_count:c \*

 $\scalebox{seq\_count:N} \langle sequence \rangle$ 

New: 2012-07-13

Leaves the number of items in the  $\langle sequence \rangle$  in the input stream as an  $\langle integer\ denotation \rangle$ . The total number of items in a  $\langle sequence \rangle$  will include those which are empty and duplicates, *i.e.* every item in a  $\langle sequence \rangle$  is unique.

### 8 Using the content of sequences directly

```
\seq_use:Nnnn *
\seq_use:cnnn *
```

```
New: 2013-05-26
```

```
\sq_use: Nnnn \  \  \langle seq\ var \rangle \  \{ \langle separator\ between\ two \rangle \} \  \  \{ \langle separator\ between\ final\ two \rangle \} \  \  \{ \langle separator\ between\ final\ two \rangle \} \  \  \{ \langle separator\ between\ final\ two \rangle \} \  \  \} \  \
```

Places the contents of the  $\langle seq\ var \rangle$  in the input stream, with the appropriate  $\langle separator \rangle$  between the items. Namely, if the sequence has more than two items, the  $\langle separator \rangle$  between more than  $two \rangle$  is placed between each pair of items except the last, for which the  $\langle separator\ between\ final\ two \rangle$  is used. If the sequence has exactly two items, then they are placed in the input stream separated by the  $\langle separator\ between\ two \rangle$ . If the sequence has a single item, it is placed in the input stream, and an empty sequence produces no output. An error will be raised if the variable does not exist or if it is invalid.

For example,

```
\seq_set_split:Nnn \l_tmpa_seq { | } { a | b | c | {de} | f } \seq_use:Nnnn \l_tmpa_seq { ~and~ } { ,~ } { ,~and~ }
```

will insert "a, b, c, de, and f" in the input stream. The first separator argument is not used in this case because the sequence has more than 2 items.

**TEXhackers note:** The result is returned within the  $\mbox{\tt unexpanded primitive (\tt exp_not:n)}$ , which means that the  $\langle items \rangle$  will not expand further when appearing in an x-type argument expansion.

\seq\_use:Nn \*
\seq\_use:cn \*

```
New: 2013-05-26
```

```
\seq_use:Nn \langle seq var \rangle \{\langle separator \rangle\}
```

Places the contents of the  $\langle seq\ var \rangle$  in the input stream, with the  $\langle separator \rangle$  between the items. If the sequence has a single item, it is placed in the input stream with no  $\langle separator \rangle$ , and an empty sequence produces no output. An error will be raised if the variable does not exist or if it is invalid.

For example,

```
\seq_set_split:Nnn \l_tmpa_seq { | } { a | b | c | {de} | f } \seq_use:Nn \l_tmpa_seq { ~and~ }
```

will insert "a and b and c and de and f" in the input stream.

**TEXhackers note:** The result is returned within the \unexpanded primitive (\exp\_not:n), which means that the  $\langle items \rangle$  will not expand further when appearing in an x-type argument expansion.

# 9 Sequences as stacks

Sequences can be used as stacks, where data is pushed to and popped from the top of the sequence. (The left of a sequence is the top, for performance reasons.) The stack functions for sequences are not intended to be mixed with the general ordered data functions detailed in the previous section: a sequence should either be used as an ordered data type or as a stack, but not in both ways.

\seq\_get:NN \seq\_get:cN

\seq\_get:NN \langle sequence \rangle \tanken list variable \rangle

Updated: 2012-05-14

Reads the top item from a  $\langle sequence \rangle$  into the  $\langle token\ list\ variable \rangle$  without removing it from the  $\langle sequence \rangle$ . The  $\langle token\ list\ variable \rangle$  is assigned locally. If  $\langle sequence \rangle$  is empty the  $\langle token\ list\ variable \rangle$  will contain the special marker  $q_no_value$ .

\seq\_pop:NN \seq\_pop:cN

 $\ensuremath{\mathtt{NN}}\ \langle \mathtt{sequence} \rangle\ \langle \mathtt{token}\ \mathtt{list}\ \mathtt{variable} \rangle$ 

Updated: 2012-05-14

Pops the top item from a  $\langle sequence \rangle$  into the  $\langle token\ list\ variable \rangle$ . Both of the variables are assigned locally. If  $\langle sequence \rangle$  is empty the  $\langle token\ list\ variable \rangle$  will contain the special marker  $q_no_value$ .

\seq\_gpop:NN \seq\_gpop:cN

\seq\_gpop:NN \(\langle sequence \rangle \tau token list variable \rangle \)

Updated: 2012-05-14

Pops the top item from a  $\langle sequence \rangle$  into the  $\langle token\ list\ variable \rangle$ . The  $\langle sequence \rangle$  is modified globally, while the  $\langle token\ list\ variable \rangle$  is assigned locally. If  $\langle sequence \rangle$  is empty the  $\langle token\ list\ variable \rangle$  will contain the special marker  $\q$  no value.

\seq\_get:NNTF \seq\_get:cNTF  $\seq_get:NNTF \ \langle sequence \rangle \ \langle token \ list \ variable \rangle \ \{\langle true \ code \rangle\} \ \{\langle false \ code \rangle\}$ 

New: 2012-05-14 Updated: 2012-05-19 If the  $\langle sequence \rangle$  is empty, leaves the  $\langle false\ code \rangle$  in the input stream. The value of the  $\langle token\ list\ variable \rangle$  is not defined in this case and should not be relied upon. If the  $\langle sequence \rangle$  is non-empty, stores the top item from a  $\langle sequence \rangle$  in the  $\langle token\ list\ variable \rangle$  without removing it from the  $\langle sequence \rangle$ . The  $\langle token\ list\ variable \rangle$  is assigned locally.

\seq\_pop:NN<u>TF</u>
\seq\_pop:cN<u>TF</u>

 $\verb|\seq_pop:NNTF| & \langle sequence \rangle & \langle token \ list \ variable \rangle & \{\langle true \ code \rangle\} & \{\langle false \ code \rangle\} \\$ 

New: 2012-05-14 Updated: 2012-05-19 If the  $\langle sequence \rangle$  is empty, leaves the  $\langle false\ code \rangle$  in the input stream. The value of the  $\langle token\ list\ variable \rangle$  is not defined in this case and should not be relied upon. If the  $\langle sequence \rangle$  is non-empty, pops the top item from the  $\langle sequence \rangle$  in the  $\langle token\ list\ variable \rangle$ , i.e. removes the item from the  $\langle sequence \rangle$ . Both the  $\langle sequence \rangle$  and the  $\langle token\ list\ variable \rangle$  are assigned locally.

\seq\_gpop:NNTF \seq\_gpop:cNTF  $\verb|\seq_gpop:NNTF| & \langle sequence \rangle & \langle token \ list \ variable \rangle & \{\langle true \ code \rangle\} & \{\langle false \ code \rangle\} \\$ 

New: 2012-05-14 Updated: 2012-05-19 If the  $\langle sequence \rangle$  is empty, leaves the  $\langle false\ code \rangle$  in the input stream. The value of the  $\langle token\ list\ variable \rangle$  is not defined in this case and should not be relied upon. If the  $\langle sequence \rangle$  is non-empty, pops the top item from the  $\langle sequence \rangle$  in the  $\langle token\ list\ variable \rangle$ , i.e. removes the item from the  $\langle sequence \rangle$ . The  $\langle sequence \rangle$  is modified globally, while the  $\langle token\ list\ variable \rangle$  is assigned locally.

\seq\_push:Nn

 $\seq_push:Nn \seq_uence \fightharpoonup \{(item)}\$ 

 $\scalebox{ } \scalebox{ } \sc$ 

\seq\_gpush:Nn

 $\scalebox{ } \scalebox{ } \sc$ 

Adds the  $\{\langle item \rangle\}$  to the top of the  $\langle sequence \rangle$ .

### 10 Sequences as sets

Sequences can also be used as sets, such that all of their items are distinct. Usage of sequences as sets is not currently widespread, hence no specific set function is provided. Instead, it is explained here how common set operations can be performed by combining several functions described in earlier sections. When using sequences to implement sets, one should be careful not to rely on the order of items in the sequence representing the set.

Sets should not contain several occurences of a given item. To make sure that a  $\langle sequence\ variable \rangle$  only has distinct items, use  $\langle seq\_remove\_duplicates: \mathbb{N}\ \langle sequence\ variable \rangle$ . This function is relatively slow, and to avoid performance issues one should only use it when necessary.

Some operations on a set  $\langle seq\ var \rangle$  are straightforward. For instance,  $seq\_count:N \langle seq\ var \rangle$  expands to the number of items, while  $seq\_if\_in:Nn(TF) \langle seq\ var \rangle \{\langle item \rangle\}$  tests if the  $\langle item \rangle$  is in the set.

Adding an  $\langle item \rangle$  to a set  $\langle seq\ var \rangle$  can be done by appending it to the  $\langle seq\ var \rangle$  if it is not already in the  $\langle seq\ var \rangle$ :

```
\ensuremath{\verb|seq_if_in:NnF||} $$ \langle seq var \rangle $$ {\langle item \rangle} $$ $$ \{ \geq put_right:Nn \langle seq var \rangle $$ {\langle item \rangle} $$ $$ $$
```

Removing an  $\langle item \rangle$  from a set  $\langle seq var \rangle$  can be done using \seq\_remove\_all:Nn,

```
\ensuremath{\mbox{seq\_remove\_all:Nn}} \langle \ensuremath{\mbox{seq}} \ensuremath{\mbox{var}} \rangle \ \{\langle \ensuremath{\mbox{item}} \rangle\}
```

The intersection of two sets  $\langle seq \ var_1 \rangle$  and  $\langle seq \ var_2 \rangle$  can be stored into  $\langle seq \ var_3 \rangle$  by collecting items of  $\langle seq \ var_1 \rangle$  which are in  $\langle seq \ var_2 \rangle$ .

```
\ensuremath{\verb|color||} \ensuremath{\|color||} \ensuremath{\|color|
```

The code as written here only works if  $\langle seq\ var_3 \rangle$  is different from the other two sequence variables. To cover all cases, items should first be collected in a sequence  $\1_-\langle pkg \rangle$ \_internal\_seq, then  $\langle seq\ var_3 \rangle$  should be set equal to this internal sequence. The same remark applies to other set functions.

The union of two sets  $\langle seq \ var_1 \rangle$  and  $\langle seq \ var_2 \rangle$  can be stored into  $\langle seq \ var_3 \rangle$  through

```
\ensuremath{\verb|seq_concat:NNN||} \langle seq \ensuremath{ var_3} \rangle \langle seq \ensuremath{ var_1} \rangle \langle seq \ensuremath{ var_2} \rangle \\ \\ \ensuremath{\verb|seq_remove_duplicates:N||} \langle seq \ensuremath{ var_3} \rangle \\ \\
```

or by adding items to (a copy of)  $\langle seq \ var_1 \rangle$  one by one

The second approach is faster than the first when the  $\langle seq \ var_2 \rangle$  is short compared to  $\langle seq \ var_1 \rangle$ .

The difference of two sets  $\langle seq \ var_1 \rangle$  and  $\langle seq \ var_2 \rangle$  can be stored into  $\langle seq \ var_3 \rangle$  by removing items of the  $\langle seq \ var_2 \rangle$  from (a copy of) the  $\langle seq \ var_1 \rangle$  one by one.

```
\end{argunitarization} $\eq_set_eq:NN $$ \langle seq\ var_3\rangle $$ \langle seq\ var_1\rangle $$ \\ \end{argunitarization} $$ \langle seq\ var_2\rangle $$ $$ \langle seq\_remove\_all:Nn $$ \langle seq\ var_3\rangle $$ $$ $$ $$ \} $$
```

The symmetric difference of two sets  $\langle seq\ var_1 \rangle$  and  $\langle seq\ var_2 \rangle$  can be stored into  $\langle seq\ var_3 \rangle$  by computing the difference between  $\langle seq\ var_1 \rangle$  and  $\langle seq\ var_2 \rangle$  and storing the result as  $\1_-\langle pkg \rangle$ \_internal\_seq, then the difference between  $\langle seq\ var_2 \rangle$  and  $\langle seq\ var_1 \rangle$ , and finally concatenating the two differences to get the symmetric differences.

```
\label{eq:nn_local} $$ \left( seq_{1} \times 1_{c} \right) \le q_{1} \le q_{2} \le q_{2}
```

# 11 Constant and scratch sequences

\c\_empty\_seq

Constant that is always empty.

New: 2012-07-02

\l\_tmpa\_seq
\l\_tmpb\_seq

New: 2012-04-26

Scratch sequences for local assignment. These are never used by the kernel code, and so are safe for use with any LATEX3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.

\g\_tmpa\_seq \g\_tmpb\_seq

New: 2012-04-26

Scratch sequences for global assignment. These are never used by the kernel code, and so are safe for use with any IATEX3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.

### 12 Viewing sequences

\seq\_show:N \seq\_show:c

\seq\_show:N \langle sequence \rangle

Updated: 2015-08-01

Displays the entries in the  $\langle sequence \rangle$  in the terminal.

# 13 Internal sequence functions

\s\_\_seq

This scan mark (equal to \scan\_stop:) marks the beginning of a sequence variable.

 $\sum_{\text{seq\_item:n}} \star$ 

 $\_\_$ seq\_item:n  $\{\langle item \rangle\}$ 

The internal token used to begin each sequence entry. If expanded outside of a mapping or manipulation function, an error will be raised. The definition should always be set globally.

\\_\_seq\_push\_item\_def:n
\\_\_seq\_push\_item\_def:x

Saves the definition of  $\_\_seq\_item:n$  and redefines it to accept one parameter and expand to  $\langle code \rangle$ . This function should always be balanced by use of  $\_\_seq\_pop\_-item\_def:$ .

\\_\_seq\_pop\_item\_def:

\\_\_seq\_pop\_item\_def:

Restores the definition of \\_\_seq\_item:n most recently saved by \\_\_seq\_push\_item\_-def:n. This function should always be used in a balanced pair with \\_\_seq\_push\_-item\_def:n.

#### Part XIV

# The **I3clist** package Comma separated lists

Comma lists contain ordered data where items can be added to the left or right end of the list. The resulting ordered list can then be mapped over using \clist\_map\_function:NN. Several items can be added at once, and spaces are removed from both sides of each item on input. Hence,

```
\clist_new:N \l_my_clist
\clist_put_left:Nn \l_my_clist { ~ a ~ , ~ {b} ~ }
\clist_put_right:Nn \l_my_clist { ~ { c ~ } , d }
```

results in  $\l_my_clist$  containing a,{b},{c~},d. Comma lists cannot contain empty items, thus

```
\clist_clear_new:N \l_my_clist
\clist_put_right:Nn \l_my_clist { , ~ , , }
\clist_if_empty:NTF \l_my_clist { true } { false }
```

will leave true in the input stream. To include an item which contains a comma, or starts or ends with a space, surround it with braces. The sequence data type should be preferred to comma lists if items are to contain {, }, or # (assuming the usual TEX category codes apply).

# 1 Creating and initialising comma lists

\clist\_new:N
\clist\_new:c

```
\clist_new:N \ \langle comma \ list \rangle
```

Creates a new  $\langle comma \ list \rangle$  or raises an error if the name is already taken. The declaration is global. The  $\langle comma \ list \rangle$  will initially contain no items.

\clist\_const:Nn
\clist\_const:(Nx|cn|cx)

```
\verb|\clist_const:Nn| \langle clist| var \rangle | \{\langle comma| list \rangle\}|
```

New: 2014-07-05

Creates a new constant  $\langle clist \ var \rangle$  or raises an error if the name is already taken. The value of the  $\langle clist \ var \rangle$  will be set globally to the  $\langle comma \ list \rangle$ .

\clist\_clear:N
\clist\_clear:c
\clist\_gclear:N
\clist\_gclear:c

```
\clist_clear:N \( comma list \)
```

Clears all items from the  $\langle comma \ list \rangle$ .

\clist\_clear\_new:N \clist\_clear\_new:c \clist\_gclear\_new:N \clist\_gclear\_new:c

 $\clist_clear_new:N\ \langle comma\ list \rangle$ 

Ensures that the \(\langle comma \ list \rangle \) exists globally by applying \clist\_new:N if necessary, then applies \clist\_(g) clear:N to leave the list empty.

\clist\_set\_eq:NN
\clist\_set\_eq:(cN|Nc|cc)
\clist\_gset\_eq:NN
\clist\_gset\_eq:(cN|Nc|cc)

 $\clist_set_eq:NN \ \langle comma \ list_1 \rangle \ \langle comma \ list_2 \rangle$ 

Sets the content of  $\langle comma \ list_1 \rangle$  equal to that of  $\langle comma \ list_2 \rangle$ .

\clist\_set\_from\_seq:NN \( comma list \) \( \sequence \)

\clist\_set\_from\_seq:NN
\clist\_set\_from\_seq:(cN|Nc|cc)
\clist\_gset\_from\_seq:NN
\clist\_gset\_from\_seq:(cN|Nc|cc)

N|NC|CC)

New: 2014-07-17

Converts the data in the  $\langle sequence \rangle$  into a  $\langle comma\ list \rangle$ : the original  $\langle sequence \rangle$  is unchanged. Items which contain either spaces or commas are surrounded by braces.

\clist\_concat:NNN
\clist\_concat:ccc
\clist\_gconcat:NNN
\clist\_gconcat:ccc

 $\clist_{concat}:NNN \ \langle comma \ list_1 \rangle \ \langle comma \ list_2 \rangle \ \langle comma \ list_3 \rangle$ 

Concatenates the content of  $\langle comma \; list_2 \rangle$  and  $\langle comma \; list_3 \rangle$  together and saves the result in  $\langle comma \; list_1 \rangle$ . The items in  $\langle comma \; list_2 \rangle$  will be placed at the left side of the new comma list.

\clist\_if\_exist\_p:N \*
\clist\_if\_exist:p:c \*
\clist\_if\_exist:NTF \*
\clist\_if\_exist:cTF \*

 $\clist_if_exist_p:N \ \langle comma \ list \rangle \\ \clist_if_exist:NTF \ \langle comma \ list \rangle \ \{\langle true \ code \rangle\} \ \{\langle false \ code \rangle\}$ 

Tests whether the  $\langle comma \ list \rangle$  is currently defined. This does not check that the  $\langle comma \ list \rangle$  really is a comma list.

New: 2012-03-03

# 2 Adding data to comma lists

\clist\_set:Nn
\clist\_set:(NV|No|Nx|cn|cV|co|cx)
\clist\_gset:Nn
\clist\_gset:(NV|No|Nx|cn|cV|co|cx)

 $\clist_set:Nn\ \langle comma\ list 
angle\ \{\langle item_1 
angle, \ldots, \langle item_n 
angle\}$ 

New: 2011-09-06

Sets  $\langle comma\ list \rangle$  to contain the  $\langle items \rangle$ , removing any previous content from the variable. Spaces are removed from both sides of each item.

Appends the  $\langle items \rangle$  to the left of the  $\langle comma\ list \rangle$ . Spaces are removed from both sides of each item.

Appends the  $\langle items \rangle$  to the right of the  $\langle comma \; list \rangle$ . Spaces are removed from both sides of each item.

# 3 Modifying comma lists

While comma lists are normally used as ordered lists, it may be necessary to modify the content. The functions here may be used to update comma lists, while retaining the order of the unaffected entries.

```
\clist_remove_duplicates:N \clist_remove_duplicates:N \clist_gremove_duplicates:N \clist_gremove_duplicates:C \clist_gremove_duplicates:C
```

Removes duplicate items from the  $\langle comma \; list \rangle$ , leaving the left most copy of each item in the  $\langle comma \; list \rangle$ . The  $\langle item \rangle$  comparison takes place on a token basis, as for  $\t= eq:nn(TF)$ .

**TEXhackers note:** This function iterates through every item in the  $\langle comma\ list \rangle$  and does a comparison with the  $\langle items \rangle$  already checked. It is therefore relatively slow with large comma lists. Furthermore, it will not work if any of the items in the  $\langle comma\ list \rangle$  contains  $\{$ ,  $\}$ , or # (assuming the usual TEX category codes apply).

```
\clist_remove_all:Nn
\clist_remove_all:cn
\clist_gremove_all:Nn
\clist_gremove_all:cn
```

```
\clist_{remove\_all:Nn} \langle comma \ list \rangle \ \{\langle item \rangle\}
```

Removes every occurrence of  $\langle item \rangle$  from the  $\langle comma \ list \rangle$ . The  $\langle item \rangle$  comparison takes place on a token basis, as for  $\t1_if_eq:nn(TF)$ .

Updated: 2011-09-06

**TEXhackers note:** The  $\langle item \rangle$  may not contain  $\{$ ,  $\}$ , or # (assuming the usual TEX category codes apply).

\clist\_reverse:N \clist\_reverse:C \clist\_greverse:N \clist\_greverse:C New: 2014-07-18

 $\verb|\clist_reverse:N| \langle \mathit{comma} \; \mathit{list} \rangle|$ 

Reverses the order of items stored in the  $\langle comma \ list \rangle$ .

\clist\_reverse:n

\clist\_reverse:n {\langle comma list \rangle}

New: 2014-07-18

Leaves the items in the  $\langle comma\ list \rangle$  in the input stream in reverse order. Braces and spaces are preserved by this process.

**TeXhackers note:** The result is returned within \unexpanded, which means that the comma list will not expand further when appearing in an x-type argument expansion.

# 4 Comma list conditionals

```
\clist_if_empty_p:N \ \clist_if_empty_p:N \ \clist_if_empty_p:N \ \clist_if_empty:NTF \ \clist_if_empty:NTF \ \clist_if_empty:NTF \ \times \ \clist_if_empty:cTF \ \ \times \ \clist_if_empty:cTF \ \times \ \clist_if_empty:cTF \ \ \times \ \clist_if_empty:cTF \ \times \ \clist_if_empty:cTF \ \ \times \ \clist_if_empty:cTF \ \ \times \ \clist_if_empty:cTF \ \times \ \clist_if_empty:cTF \ \ \times \ \clist_if_empty:cTF \ \times \ \clist_if_empty:cTF \ \ \times \ \clist_if_empty:cTF \ \times \ \clist_if_empty:cTF \ \ \times \ \clist_if_empty:cTF \ \times \ \clist_if_empty:cTF \ \ \times \ \clist_if_emp
```

```
\clist_if_empty_p:n {$\langle comma \; list \rangle$} \\ \clist_if_empty:nTF {$\langle comma \; list \rangle$} {\langle true \; code \rangle$} {$\langle false \; code \rangle$}
```

New: 2014-07-05

\clist\_if\_empty\_p:n \*

\clist\_if\_empty:nTF

Tests if the  $\langle comma \; list \rangle$  is empty (containing no items). The rules for space trimming are as for other n-type comma-list functions, hence the comma list  $\{ \sim, \sim, \sim \}$  (without outer braces) is empty, while  $\{ \sim, \{ \}, \}$  (without outer braces) contains one element, which happens to be empty: the comma-list is not empty.

```
\label{limin_code} $$ \begin{array}{ll} \end{array} \end{array} \end{array} & \begin{array}{ll} \begin{array}{ll} \begin{array}{ll} \end{array} \end{array} & \begin{array}{ll} \end{array} & \end{array} & \begin{array}{ll} \end{array} & \end{array} & \begin{array}{ll} \end{array} & \begin{array}{ll} \end{array} & \begin{array}{ll} \end{array} & \begin{array}{ll} \end{array} & \end{array} & \begin{array}{ll} \end{array} & \end{array} & \begin{array}{ll} \end{array} & \begin{array}{ll} \end{array} & \begin{array}{ll} \end{array} & \begin{array}{ll} \end{array} & \begin{array}{ll} \end{array} & \end{array} & \begin{array}{ll} \end{array} & \end{array} & \begin{array}{ll} \end{array} & \begin{array}{ll} \end{array} & \begin{array}{ll} \end{array} & \begin{array}{ll} \end{array} & \begin{array}{ll} \end{array} & \begin{array}{ll} \end{array} & \begin{array}{ll} \end{array} & \begin{array}{ll} \end{array} & \begin{array}{ll} \end{array} & \begin{array}{ll} \end{array} & \begin{array}{ll} \end{array} & \end{array} & \begin{array}{ll} \end{array} & \begin{array}{ll} \end{array} & \begin{array}{ll} \end{array} & \end{array} & \begin{array}{ll} \end{array} & \begin{array}{ll} \end{array} & \begin{array}{ll} \end{array} & \end{array} & \begin{array}{ll} \end{array} & \end{array} & \begin{array}{ll} \end{array} & \end{array} & \begin{array}{ll} \end{array} & \end{array} & \begin{array}{ll} \end{array} & \begin{array}{ll} \end{array} & \begin{array}{ll} \end{array} & \begin{array}{ll} \end{array} & \end{array} & \begin{array}{ll} \end{array}
```

Tests if the  $\langle item \rangle$  is present in the  $\langle comma\ list \rangle$ . In the case of an n-type  $\langle comma\ list \rangle$ , spaces are stripped from each item, but braces are not removed. Hence,

```
\clist_if_in:nnTF { a , {b}~, {b} , c } { b } {true} {false} yields false.
```

**TeXhackers note:** The  $\langle item \rangle$  may not contain  $\{, \}$ , or # (assuming the usual TeX category codes apply), and should not contain , nor start or end with a space.

# 5 Mapping to comma lists

The functions described in this section apply a specified function to each item of a comma list

When the comma list is given explicitly, as an n-type argument, spaces are trimmed around each item. If the result of trimming spaces is empty, the item is ignored. Otherwise, if the item is surrounded by braces, one set is removed, and the result is passed to the mapped function. Thus, if your comma list that is being mapped is  $\{a_{\sqcup},_{\sqcup}\{\{b\}_{\sqcup}\},_{\sqcup},\{\}\},_{\sqcup}\{c\},\}$  then the arguments passed to the mapped function are 'a', ' $\{b\}_{\sqcup}$ ', an empty argument, and 'c'.

When the comma list is given as an N-type argument, spaces have already been trimmed on input, and items are simply stripped of one set of braces if any. This case is more efficient than using n-type comma lists.

Updated: 2012-06-29

\clist\_map\_variable:NNn
\clist\_map\_variable:nNn
\clist\_map\_variable:nNn

Updated: 2012-06-29

 $\verb|\clist_map_function:NN| & \langle \textit{comma list} \rangle & \langle \textit{function} \rangle \\$ 

Applies  $\langle function \rangle$  to every  $\langle item \rangle$  stored in the  $\langle comma \ list \rangle$ . The  $\langle function \rangle$  will receive one argument for each iteration. The  $\langle items \rangle$  are returned from left to right. The function  $\clist_map_inline:Nn$  is in general more efficient than  $\clist_map_function:Nn$ . One mapping may be nested inside another.

 $\verb|\clist_map_inline:Nn| & comma list| & \{ \langle inline function \rangle \}$ 

Applies  $\langle inline\ function \rangle$  to every  $\langle item \rangle$  stored within the  $\langle comma\ list \rangle$ . The  $\langle inline\ function \rangle$  should consist of code which will receive the  $\langle item \rangle$  as #1. One in line mapping can be nested inside another. The  $\langle items \rangle$  are returned from left to right.

 $\clist_map_variable:NNn \clist\cli$ 

Stores each entry in the  $\langle comma\ list \rangle$  in turn in the  $\langle tl\ var. \rangle$  and applies the  $\langle function\ using\ tl\ var. \rangle$  The  $\langle function \rangle$  will usually consist of code making use of the  $\langle tl\ var. \rangle$ , but this is not enforced. One variable mapping can be nested inside another. The  $\langle items \rangle$  are returned from left to right.

\clist\_map\_break: ☆

\clist\_map\_break:

Updated: 2012-06-29

Used to terminate a  $\clist_map_...$  function before all entries in the  $\langle comma\ list \rangle$  have been processed. This will normally take place within a conditional statement, for example

Use outside of a \clist\_map\_... scenario will lead to low level TeX errors.

**TEXhackers note:** When the mapping is broken, additional tokens may be inserted by the internal macro \\_\_prg\_break\_point:Nn before further items are taken from the input stream. This will depend on the design of the mapping function.

\clist\_map\_break:n ☆

 $\clist_map_break:n {\langle tokens \rangle}$ 

Updated: 2012-06-29

Used to terminate a  $\clist_map_...$  function before all entries in the  $\langle comma\ list\rangle$  have been processed, inserting the  $\langle tokens\rangle$  after the mapping has ended. This will normally take place within a conditional statement, for example

Use outside of a \clist\_map\_... scenario will lead to low level TFX errors.

**TeXhackers note:** When the mapping is broken, additional tokens may be inserted by the internal macro  $\_\_prg\_break\_point:Nn$  before the  $\langle tokens \rangle$  are inserted into the input stream. This will depend on the design of the mapping function.

\clist\_count:N \*
\clist\_count:c \*
\clist\_count:n \*

New: 2012-07-13

 $\verb|\clist_count:N| \langle \mathit{comma list} \rangle|$ 

Leaves the number of items in the  $\langle comma \ list \rangle$  in the input stream as an  $\langle integer \ denotation \rangle$ . The total number of items in a  $\langle comma \ list \rangle$  will include those which are duplicates, *i.e.* every item in a  $\langle comma \ list \rangle$  is unique.

# 6 Using the content of comma lists directly

```
\clist_use:Nnnn *
\clist_use:cnnn *
```

New: 2013-05-26

```
\clist_use:Nnnn \ \langle clist \ var \rangle \ \{\langle separator \ between \ two \rangle\} \ \{\langle separator \ between \ more \ than \ two \rangle\} \ \{\langle separator \ between \ final \ two \rangle\}
```

Places the contents of the  $\langle clist\;var\rangle$  in the input stream, with the appropriate  $\langle separator\rangle$  between the items. Namely, if the comma list has more than two items, the  $\langle separator\rangle$  between more than  $two\rangle$  is placed between each pair of items except the last, for which the  $\langle separator\;between\;final\;two\rangle$  is used. If the comma list has exactly two items, then they are placed in the input stream separated by the  $\langle separator\;between\;two\rangle$ . If the comma list has a single item, it is placed in the input stream, and a comma list with no items produces no output. An error will be raised if the variable does not exist or if it is invalid.

For example,

```
\clist_set:Nn \l_tmpa_clist { a , b , , c , {de} , f }
\clist_use:Nnnn \l_tmpa_clist { ~and~ } { ,~ } { ,~and~ }
```

will insert "a, b, c, de, and f" in the input stream. The first separator argument is not used in this case because the comma list has more than 2 items.

**TEXhackers note:** The result is returned within the \unexpanded primitive (\exp\_not:n), which means that the  $\langle items \rangle$  will not expand further when appearing in an x-type argument expansion.

\clist\_use:Nn \*
\clist\_use:cn \*

New: 2013-05-26

```
\clist_use:Nn \langle clist var \rangle \{\langle separator \rangle\}
```

Places the contents of the  $\langle clist \ var \rangle$  in the input stream, with the  $\langle separator \rangle$  between the items. If the comma list has a single item, it is placed in the input stream, and a comma list with no items produces no output. An error will be raised if the variable does not exist or if it is invalid.

For example,

```
\clist_set:Nn \l_tmpa_clist { a , b , , c , {de} , f }
\clist_use:Nn \l_tmpa_clist { ~and~ }
```

will insert "a and b and c and de and f" in the input stream.

**TEXhackers note:** The result is returned within the  $\mbox{\sc hunexpanded primitive (\exp_not:n)}$ , which means that the  $\mbox{\sc items}$  will not expand further when appearing in an x-type argument expansion.

### 7 Comma lists as stacks

Comma lists can be used as stacks, where data is pushed to and popped from the top of the comma list. (The left of a comma list is the top, for performance reasons.) The

stack functions for comma lists are not intended to be mixed with the general ordered data functions detailed in the previous section: a comma list should either be used as an ordered data type or as a stack, but not in both ways.

\clist\_get:NN
\clist\_get:cN

 $\clist_get:NN \ \langle comma \ list \rangle \ \langle token \ list \ variable \rangle$ 

Updated: 2012-05-14

Stores the left-most item from a  $\langle comma \ list \rangle$  in the  $\langle token \ list \ variable \rangle$  without removing it from the  $\langle comma \ list \rangle$ . The  $\langle token \ list \ variable \rangle$  is assigned locally. If the  $\langle comma \ list \rangle$  is empty the  $\langle token \ list \ variable \rangle$  will contain the marker value  $\backslash q$  no value.

\clist\_get:NNTF \clist\_get:cNTF  $\clist_get:NNTF\ \langle comma\ list \rangle\ \langle token\ list\ variable \rangle\ \{\langle true\ code \rangle\}\ \{\langle false\ code \rangle\}$ 

New: 2012-05-14

If the  $\langle comma \ list \rangle$  is empty, leaves the  $\langle false \ code \rangle$  in the input stream. The value of the  $\langle token \ list \ variable \rangle$  is not defined in this case and should not be relied upon. If the  $\langle comma \ list \rangle$  is non-empty, stores the top item from the  $\langle comma \ list \rangle$  in the  $\langle token \ list \ variable \rangle$  without removing it from the  $\langle comma \ list \rangle$ . The  $\langle token \ list \ variable \rangle$  is assigned locally.

\clist\_pop:NN
\clist\_pop:cN

\clist\_pop:NN \( comma list \) \( \taken list variable \)

Updated: 2011-09-06

Pops the left-most item from a  $\langle comma \ list \rangle$  into the  $\langle token \ list \ variable \rangle$ , i.e. removes the item from the comma list and stores it in the  $\langle token \ list \ variable \rangle$ . Both of the variables are assigned locally.

\clist\_gpop:NN \clist\_gpop:cN \clist\_gpop:NN \( comma list \) \( \taken list variable \)

Pops the left-most item from a  $\langle comma \ list \rangle$  into the  $\langle token \ list \ variable \rangle$ , i.e. removes the item from the comma list and stores it in the  $\langle token \ list \ variable \rangle$ . The  $\langle comma \ list \rangle$  is modified globally, while the assignment of the  $\langle token \ list \ variable \rangle$  is local.

\clist\_pop:NNTF \clist\_pop:cNTF  $\left( \text{clist\_pop:NNTF} \left( \text{comma list} \right) \left( \text{token list variable} \right) \left( \text{true code} \right) \left( \left( \text{false code} \right) \right) \right)$ 

New: 2012-05-14

If the  $\langle comma \ list \rangle$  is empty, leaves the  $\langle false \ code \rangle$  in the input stream. The value of the  $\langle token \ list \ variable \rangle$  is not defined in this case and should not be relied upon. If the  $\langle comma \ list \rangle$  is non-empty, pops the top item from the  $\langle comma \ list \rangle$  in the  $\langle token \ list \rangle$  and the  $\langle token \ list \ variable \rangle$ , i.e. removes the item from the  $\langle comma \ list \rangle$ . Both the  $\langle comma \ list \rangle$  and the  $\langle token \ list \ variable \rangle$  are assigned locally.

\clist\_gpop:NNTF \clist\_gpop:cNTF  $\clist_gpop:NNTF\ (comma\ list)\ (token\ list\ variable)\ \{(true\ code)\}\ \{(false\ code)\}$ 

New: 2012-05-14

If the  $\langle comma \ list \rangle$  is empty, leaves the  $\langle false \ code \rangle$  in the input stream. The value of the  $\langle token \ list \ variable \rangle$  is not defined in this case and should not be relied upon. If the  $\langle comma \ list \rangle$  is non-empty, pops the top item from the  $\langle comma \ list \rangle$  in the  $\langle token \ list \ variable \rangle$ , i.e. removes the item from the  $\langle comma \ list \rangle$ . The  $\langle comma \ list \rangle$  is modified globally, while the  $\langle token \ list \ variable \rangle$  is assigned locally.

```
\clist_push:Nn \clist_push:Nn \clist_push:Nn \clist_push:\n \clist_push:\n \clist_push:\n \clist_push:\n \clist_push:\n \clist_gpush:\n \clist
```

Adds the  $\{\langle items \rangle\}$  to the top of the  $\langle comma\ list \rangle$ . Spaces are removed from both sides of each item.

# 8 Using a single item

\clist\_item:Nn \*
\clist\_item:cn \*
\clist\_item:nn \*
New: 2014-07-17

 $\verb|\clist_item:Nn| \langle comma | list \rangle | \{\langle integer | expression \rangle\}|$ 

Indexing items in the  $\langle comma\ list \rangle$  from 1 at the top (left), this function will evaluate the  $\langle integer\ expression \rangle$  and leave the appropriate item from the comma list in the input stream. If the  $\langle integer\ expression \rangle$  is negative, indexing occurs from the bottom (right) of the comma list. When the  $\langle integer\ expression \rangle$  is larger than the number of items in the  $\langle comma\ list \rangle$  (as calculated by  $\clist\_count:N$ ) then the function will expand to nothing.

**TEXhackers note:** The result is returned within the \unexpanded primitive (\exp\_not:n), which means that the  $\langle item \rangle$  will not expand further when appearing in an x-type argument expansion.

# 9 Viewing comma lists

\clist\_show:N

\clist\_show:N \( comma list \)

\clist\_show:c

Displays the entries in the  $\langle comma \ list \rangle$  in the terminal.

Updated: 2015-08-03

\clist\_show:n

 $\clist_show:n {\langle tokens \rangle}$ 

Updated: 2013-08-03

Displays the entries in the comma list in the terminal.

### 10 Constant and scratch comma lists

\c\_empty\_clist

Constant that is always empty.

New: 2012-07-02

\_\_\_\_\_ \l\_tmpa\_clist

Scratch comma lists for local assignment. These are never used by the kernel code, and so are safe for use with any LaTeX3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.

 \g\_tmpa\_clist \g\_tmpb\_clist

New: 2011-09-06

Scratch comma lists for global assignment. These are never used by the kernel code, and so are safe for use with any  $\LaTeX$  3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.

# Part XV

# The **I3prop** package Property lists

IATEX3 implements a "property list" data type, which contain an unordered list of entries each of which consists of a  $\langle key \rangle$  and an associated  $\langle value \rangle$ . The  $\langle key \rangle$  and  $\langle value \rangle$  may both be any  $\langle balanced\ text \rangle$ . It is possible to map functions to property lists such that the function is applied to every key–value pair within the list.

Each entry in a property list must have a unique  $\langle key \rangle$ : if an entry is added to a property list which already contains the  $\langle key \rangle$  then the new entry will overwrite the existing one. The  $\langle keys \rangle$  are compared on a string basis, using the same method as  $\mathsf{str_if_eq:nn}$ .

Property lists are intended for storing key-based information for use within code. This is in contrast to key-value lists, which are a form of *input* parsed by the keys module.

# 1 Creating and initialising property lists

\prop\_new:N
\prop\_new:c

\prop\_new:N \( property list \)

Creates a new  $\langle property \ list \rangle$  or raises an error if the name is already taken. The declaration is global. The  $\langle property \ list \rangle$  will initially contain no entries.

\prop\_clear:N
\prop\_clear:c
\prop\_gclear:N
\prop\_gclear:c

\prop\_clear:N \(\rhoperty list\)

Clears all entries from the  $\langle property \ list \rangle$ .

\prop\_clear\_new:N
\prop\_clear\_new:c
\prop\_gclear\_new:N
\prop\_gclear\_new:c

\prop\_clear\_new:N \( \rhoperty list \)

Ensures that the  $\langle property \; list \rangle$  exists globally by applying  $prop_new:N$  if necessary, then applies  $prop_(g) clear:N$  to leave the list empty.

\prop\_set\_eq:NN
\prop\_set\_eq:(cN|Nc|cc)
\prop\_gset\_eq:NN
\prop\_gset\_eq:(cN|Nc|cc)

 $\prop_set_eq:NN \property list_1 \property list_2$ 

Sets the content of  $\langle property \ list_1 \rangle$  equal to that of  $\langle property \ list_2 \rangle$ .

# 2 Adding entries to property lists

\prop\_put:Nnn

\prop\_put:(NnV|Nno|Nnx|NVn|NVV|Non|Noo|cnn|cnV|cno|cnx|cVn|cVV|con|coo)

\prop\_gput:Nnn

\prop\_gput:(NnV|Nno|Nnx|NVn|NVV|Non|Noo|cnn|cnV|cno|cnx|cVn|cVV|con|coo)

Updated: 2012-07-09

Adds an entry to the  $\langle property \ list \rangle$  which may be accessed using the  $\langle key \rangle$  and which has  $\langle value \rangle$ . Both the  $\langle key \rangle$  and  $\langle value \rangle$  may contain any  $\langle balanced \ text \rangle$ . The  $\langle key \rangle$  is stored after processing with  $\tl_to_str:n$ , meaning that category codes are ignored. If the  $\langle key \rangle$  is already present in the  $\langle property \ list \rangle$ , the existing entry is overwritten by the new  $\langle value \rangle$ .

\prop\_put:Nnn \( \rhoperty list \)

 $\{\langle key \rangle\}\ \{\langle value \rangle\}$ 

\prop\_put\_if\_new:Nnn
\prop\_put\_if\_new:cnn
\prop\_gput\_if\_new:Nnn
\prop\_gput\_if\_new:cnn

 $\prop_put_if_new: Nnn \property \ list \prop_{\prop} \end{\prop} \end{\prop}$ 

If the  $\langle key \rangle$  is present in the  $\langle property \; list \rangle$  then no action is taken. If the  $\langle key \rangle$  is not present in the  $\langle property \; list \rangle$  then a new entry is added. Both the  $\langle key \rangle$  and  $\langle value \rangle$  may contain any  $\langle balanced \; text \rangle$ . The  $\langle key \rangle$  is stored after processing with  $\t_t_s$ , meaning that category codes are ignored.

# 3 Recovering values from property lists

\prop\_get:NnN

\prop\_get:(NVN|NoN|cnN|cVN|coN)

Updated: 2011-08-28

 $\label{limits} $$ \operatorname{prop\_get:NnN} $$ \langle \operatorname{property} \ \operatorname{list} \rangle \ \{\langle \operatorname{key} \rangle\} \ \langle \operatorname{tl} \ \operatorname{var} \rangle $$$ 

Recovers the  $\langle value \rangle$  stored with  $\langle key \rangle$  from the  $\langle property \ list \rangle$ , and places this in the  $\langle token \ list \ variable \rangle$ . If the  $\langle key \rangle$  is not found in the  $\langle property \ list \rangle$  then the  $\langle token \ list \ variable \rangle$  will contain the special marker  $\neq no\_value$ . The  $\langle token \ list \ variable \rangle$  is set within the current TeX group. See also  $prop\_get:NnNTF$ .

\prop\_pop:NnN

\prop\_pop:(NoN|cnN|coN)

Updated: 2011-08-18

 $\prop\_pop:NnN \property list\parbox{$\langle key \rangle$} \prop\_for \prop\_for \property list\parbox{$\langle key \rangle$} \prop\_for \pro$ 

Recovers the  $\langle value \rangle$  stored with  $\langle key \rangle$  from the  $\langle property \ list \rangle$ , and places this in the  $\langle token \ list \ variable \rangle$ . If the  $\langle key \rangle$  is not found in the  $\langle property \ list \rangle$  then the  $\langle token \ list \ variable \rangle$  will contain the special marker  $\q_no_value$ . The  $\langle key \rangle$  and  $\langle value \rangle$  are then deleted from the property list. Both assignments are local. See also  $\prop_pop:NnNTF$ .

\prop\_gpop:NnN

\prop\_gpop:(NoN|cnN|coN)

Updated: 2011-08-18

 $\verb|\prop_gpop:NnN| \langle property \ list \rangle \ \{\langle key \rangle\} \ \langle t1 \ var \rangle$ 

Recovers the  $\langle value \rangle$  stored with  $\langle key \rangle$  from the  $\langle property \ list \rangle$ , and places this in the  $\langle token \ list \ variable \rangle$ . If the  $\langle key \rangle$  is not found in the  $\langle property \ list \rangle$  then the  $\langle token \ list \ variable \rangle$  will contain the special marker  $\q_no_value$ . The  $\langle key \rangle$  and  $\langle value \rangle$  are then deleted from the property list. The  $\langle property \ list \rangle$  is modified globally, while the assignment of the  $\langle token \ list \ variable \rangle$  is local. See also  $\prop_gpop:NnNTF$ .

```
\prop_item:Nn *
\prop_item:cn *

New: 2014-07-17
```

```
prop_item:Nn \langle property \ list \rangle \ \{\langle key \rangle\}
```

Expands to the  $\langle value \rangle$  corresponding to the  $\langle key \rangle$  in the  $\langle property \ list \rangle$ . If the  $\langle key \rangle$  is missing, this has an empty expansion.

**TEXhackers note:** This function is slower than the non-expandable analogue  $\prop_{\tt get:NnN}$ . The result is returned within the  $\prop_{\tt mot:n}$ , which means that the  $\prop_{\tt not:n}$  will not expand further when appearing in an x-type argument expansion.

# 4 Modifying property lists

\prop\_remove:Nn \prop\_remove:(NV|cn|cV) \prop\_gremove:Nn \prop\_gremove:(NV|cn|cV)

New: 2012-05-12

 $\verb|\prop_remove:Nn| \langle property \ list \rangle \ \{\langle key \rangle\}$ 

Removes the entry listed under  $\langle key \rangle$  from the  $\langle property \ list \rangle$ . If the  $\langle key \rangle$  is not found in the  $\langle property \ list \rangle$  no change occurs, *i.e* there is no need to test for the existence of a key before deleting it.

# 5 Property list conditionals

```
\prop_if_exist_p:N \(\rhoperty list\)
\prop_if_exist_p:N *
                            \prop_if_exist_p:c
\prop_if_exist:NTF
                            Tests whether the (property list) is currently defined. This does not check that the
\prop_if_exist:cTF *
                            (property list) really is a property list variable.
           New: 2012-03-03
                            \prop_if_empty_p:N \(\rangle property list \rangle \)
\prop_if_empty_p:N *

\prop_if_in:(NV|No|cn|cV|co)TF
                   Updated: 2011-09-15
```

Tests if the  $\langle key \rangle$  is present in the  $\langle property \; list \rangle$ , making the comparison using the method described by  $\sr if_eq:nnTF$ .

**TEXhackers note:** This function iterates through every key-value pair in the  $\langle property \ list \rangle$  and is therefore slower than using the non-expandable  $prop_{et}:NnNTF$ .

# 6 Recovering values from property lists with branching

The functions in this section combine tests for the presence of a key in a property list with recovery of the associated valued. This makes them useful for cases where different cases follow dependent on the presence or absence of a key in a property list. They offer increased readability and performance over separate testing and recovery phases.

If the  $\langle key \rangle$  is not present in the  $\langle property \ list \rangle$ , leaves the  $\langle false \ code \rangle$  in the input stream. The value of the  $\langle token \ list \ variable \rangle$  is not defined in this case and should not be relied upon. If the  $\langle key \rangle$  is present in the  $\langle property \ list \rangle$ , stores the corresponding  $\langle value \rangle$  in the  $\langle token \ list \ variable \rangle$  without removing it from the  $\langle property \ list \rangle$ , then leaves the  $\langle true \ code \rangle$  in the input stream. The  $\langle token \ list \ variable \rangle$  is assigned locally.

```
\prop_pop: NnNTF \
\prop_pop: cnNTF
```

 $\label{list_code} $$ \displaystyle \operatorname{prop-pop:NnNTF} \ \langle \operatorname{property} \ list \rangle \ \{\langle \operatorname{key} \rangle\} \ \langle \operatorname{token} \ list \ \operatorname{variable} \rangle \ \{\langle \operatorname{true} \ \operatorname{code} \rangle\} $$$ 

New: 2011-08-18 Updated: 2012-05-19 If the  $\langle key \rangle$  is not present in the  $\langle property \ list \rangle$ , leaves the  $\langle false \ code \rangle$  in the input stream. The value of the  $\langle token \ list \ variable \rangle$  is not defined in this case and should not be relied upon. If the  $\langle key \rangle$  is present in the  $\langle property \ list \rangle$ , pops the corresponding  $\langle value \rangle$  in the  $\langle token \ list \ variable \rangle$ , i.e. removes the item from the  $\langle property \ list \rangle$ . Both the  $\langle property \ list \rangle$  and the  $\langle token \ list \ variable \rangle$  are assigned locally.

```
\prop_gpop:NnNTF
\prop_gpop:cnNTF
```

 $\label{list_variable} $$ \displaystyle \operatorname{property\ list} \ {\langle key \rangle} \ \langle token\ list\ variable \rangle \ {\langle true\ code \rangle} \ {\langle false\ code \rangle} $$$ 

New: 2011-08-18 Updated: 2012-05-19 If the  $\langle key \rangle$  is not present in the  $\langle property \ list \rangle$ , leaves the  $\langle false \ code \rangle$  in the input stream. The value of the  $\langle token \ list \ variable \rangle$  is not defined in this case and should not be relied upon. If the  $\langle key \rangle$  is present in the  $\langle property \ list \rangle$ , pops the corresponding  $\langle value \rangle$  in the  $\langle token \ list \ variable \rangle$ , i.e. removes the item from the  $\langle property \ list \rangle$ . The  $\langle property \ list \rangle$  is modified globally, while the  $\langle token \ list \ variable \rangle$  is assigned locally.

# 7 Mapping to property lists

```
\prop_map_function:NN ☆ \prop_map_function:cN ☆
```

 $\verb|\prop_map_function:NN| \langle property | list \rangle | \langle function \rangle|$ 

Updated: 2013-01-08

Applies  $\langle function \rangle$  to every  $\langle entry \rangle$  stored in the  $\langle property \ list \rangle$ . The  $\langle function \rangle$  will receive two argument for each iteration: the  $\langle key \rangle$  and associated  $\langle value \rangle$ . The order in which  $\langle entries \rangle$  are returned is not defined and should not be relied upon.

\prop\_map\_inline:Nn \prop\_map\_inline:cn

 $\verb|\prop_map_inline:Nn| \langle property | list \rangle | \{\langle inline | function \rangle\}|$ 

Updated: 2013-01-08

Applies  $\langle inline\ function \rangle$  to every  $\langle entry \rangle$  stored within the  $\langle property\ list \rangle$ . The  $\langle inline\ function \rangle$  should consist of code which will receive the  $\langle key \rangle$  as #1 and the  $\langle value \rangle$  as #2. The order in which  $\langle entries \rangle$  are returned is not defined and should not be relied upon.

\prop\_map\_break: ☆

\prop\_map\_break:

Updated: 2012-06-29

Used to terminate a  $\prop_map_...$  function before all entries in the  $\langle property \ list \rangle$  have been processed. This will normally take place within a conditional statement, for example

Use outside of a \prop\_map\_... scenario will lead to low level TFX errors.

\prop\_map\_break:n 🜣

 $prop_map_break:n {\langle tokens \rangle}$ 

Updated: 2012-06-29

Used to terminate a  $\prop_map_...$  function before all entries in the  $\langle property \ list \rangle$  have been processed, inserting the  $\langle tokens \rangle$  after the mapping has ended. This will normally take place within a conditional statement, for example

Use outside of a \prop\_map\_... scenario will lead to low level TeX errors.

# 8 Viewing property lists

\prop\_show:N
\prop\_show:c

\prop\_show:N \(\rhoperty list\)

Updated: 2015-08-01

Displays the entries in the  $\langle property \ list \rangle$  in the terminal.

145

# 9 Scratch property lists

\l\_tmpa\_prop
\l\_tmpb\_prop

New: 2012-06-23

Scratch property lists for local assignment. These are never used by the kernel code, and so are safe for use with any IATEX3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.

\g\_tmpa\_prop \g\_tmpb\_prop

New: 2012-06-23

Scratch property lists for global assignment. These are never used by the kernel code, and so are safe for use with any IATEX3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.

### 10 Constants

\c\_empty\_prop

A permanently-empty property list used for internal comparisons.

# 11 Internal property list functions

\s\_\_prop

The internal token used at the beginning of property lists. This is also used after each  $\langle key \rangle$  (see \\_\_prop\_pair:wn).

 $\_\_$ prop $\_$ pair:wn

 $\prop_pair: wn \langle key \rangle \s_prop {\langle item \rangle}$ 

The internal token used to begin each key–value pair in the property list. If expanded outside of a mapping or manipulation function, an error will be raised. The definition should always be set globally.

\l\_\_prop\_internal\_tl

Token list used to store new key-value pairs to be inserted by functions of the \prop\_-put:Nnn family.

\\_\_prop\_split:NnTF

 $\label{limits} $$ \underset{\mbox{\ensuremath{\square}-prop\_split}:NnTF \ \langle property \ list \rangle \ \{\langle key \rangle\} \ \{\langle true \ code \rangle\} \ \{\langle false \ code \rangle\} $$$ 

Updated: 2013-01-08

Splits the  $\langle property | list \rangle$  at the  $\langle key \rangle$ , giving three token lists: the  $\langle extract \rangle$  of  $\langle property | list \rangle$  before the  $\langle key \rangle$ , the  $\langle value \rangle$  associated with the  $\langle key \rangle$  and the  $\langle extract \rangle$  of the  $\langle property | list \rangle$  after the  $\langle value \rangle$ . Both  $\langle extracts \rangle$  retain the internal structure of a property list, and the concatenation of the two  $\langle extracts \rangle$  is a property list. If the  $\langle key \rangle$  is present in the  $\langle property | list \rangle$  then the  $\langle true | code \rangle$  is left in the input stream, with #1, #2, and #3 replaced by the first  $\langle extract \rangle$ , the  $\langle value \rangle$ , and the second extract. If the  $\langle key \rangle$  is not present in the  $\langle property | list \rangle$  then the  $\langle false | code \rangle$  is left in the input stream, with no trailing material. Both  $\langle true | code \rangle$  and  $\langle false | code \rangle$  are used in the replacement text of a macro defined internally, hence macro parameter characters should be doubled, except #1, #2, and #3 which stand in the  $\langle true | code \rangle$  for the three extracts from the property list. The  $\langle key \rangle$  comparison takes place as described for  $\langle true | true$ 

# Part XVI

# The I3box package

# Boxes

There are three kinds of box operations: horizontal mode denoted with prefix \hbox\_, vertical mode with prefix \vbox\_, and the generic operations working in both modes with prefix \box\_.

# 1 Creating and initialising boxes

\box\_new:N

 $\box_new:N \langle box \rangle$ 

\box\_new:c

Creates a new  $\langle box \rangle$  or raises an error if the name is already taken. The declaration is global. The  $\langle box \rangle$  will initially be void.

\box\_clear:N

 $\box_clean:N \langle box \rangle$ 

\box\_clear:c

Clears the content of the  $\langle box \rangle$  by setting the box equal to  $\c_void_box$ .

\box\_gclear:N
\box\_gclear:c

\box\_clear\_new:N

 $\box_clear_new:N \ \langle box \rangle$ 

\box\_clear\_new:c
\box\_gclear\_new:N

Ensures that the  $\langle box \rangle$  exists globally by applying \box\_new:N if necessary, then applies \box\_(g) clear:N to leave the  $\langle box \rangle$  empty.

\box\_gclear\_new:c

\box\_set\_eq:NN

 $\box_set_eq:NN \langle box_1 \rangle \langle box_2 \rangle$ 

\box\_gset\_eq:(cN|Nc|cc)
\box\_gset\_eq:(cN|Nc|cc)
\box\_gset\_eq:(cN|Nc|cc)

Sets the content of  $\langle box_1 \rangle$  equal to that of  $\langle box_2 \rangle$ .

\box\_set\_eq\_clear:NN
\box\_set\_eq\_clear:(cN|Nc|cc)

 $box_set_eq_clear:NN \langle box_1 \rangle \langle box_2 \rangle$ 

Sets the content of  $\langle box_1 \rangle$  within the current TeX group equal to that of  $\langle box_2 \rangle$ , then clears  $\langle box_2 \rangle$  globally.

\box\_gset\_eq\_clear:NN
\box\_gset\_eq\_clear:(cN|Nc|cc)

 $\box_gset_eq_clear:NN \langle box_1 \rangle \langle box_2 \rangle$ 

Sets the content of  $\langle box_1 \rangle$  equal to that of  $\langle box_2 \rangle$ , then clears  $\langle box_2 \rangle$ . These assignments are global.

```
\box_if_exist_p:N *
\box_if_exist_p:c *
\box_if_exist:NTF *
\box_if_exist:cTF *
```

```
\box_if_exist_p:N $$\langle box \rangle$$ \box_if_exist:NTF $$\langle box \rangle $$ {\langle true \ code \rangle} $$ {\langle false \ code \rangle}$
```

Tests whether the  $\langle box \rangle$  is currently defined. This does not check that the  $\langle box \rangle$  really is a box.

New: 2012-03-03

# 2 Using boxes

\box\_use:N
\box\_use:c

 $\box_use:N \ \langle box \rangle$ 

Inserts the current content of the  $\langle box \rangle$  onto the current list for typesetting.

TEXhackers note: This is the TEX primitive \copy.

\box\_use\_clear:N \box\_use\_clear:c

\box\_use\_clear:N  $\langle box \rangle$ 

Inserts the current content of the  $\langle box \rangle$  onto the current list for typesetting, then globally clears the content of the  $\langle box \rangle$ .

TeXhackers note: This is the TeX primitive \box.

\box\_move\_right:nn
\box\_move\_left:nn

 $\verb|\box_move_right:nn| \{\langle dimexpr \rangle\} \ \{\langle box\ function \rangle\}|$ 

This function operates in vertical mode, and inserts the material specified by the  $\langle box function \rangle$  such that its reference point is displaced horizontally by the given  $\langle dimexpr \rangle$  from the reference point for typesetting, to the right or left as appropriate. The  $\langle box function \rangle$  should be a box operation such as  $\box_use:N \c)$  or a "raw" box specification such as  $\box_use:N \c)$ .

\box\_move\_up:nn
\box\_move\_down:nn

 $\verb|\box_move_up:nn| {\langle dimexpr \rangle} {\langle box function \rangle}|$ 

This function operates in horizontal mode, and inserts the material specified by the  $\langle box\ function \rangle$  such that its reference point is displaced vertical by the given  $\langle dimexpr \rangle$  from the reference point for typesetting, up or down as appropriate. The  $\langle box\ function \rangle$  should be a box operation such as  $\box_use:N \c)$  or a "raw" box specification such as  $\box_use:N \c)$ .

# 3 Measuring and setting box dimensions

 $\box_dp:N$ 

\box\_dp:N \langle box \rangle

\box\_dp:c

Calculates the depth (below the baseline) of the  $\langle box \rangle$  in a form suitable for use in a  $\langle dimension \; expression \rangle$ .

TEXhackers note: This is the TEX primitive \dp.

\box\_ht:N \box\_ht:N \box\_ht:C

Calculates the height (above the baseline) of the  $\langle box \rangle$  in a form suitable for use in a  $\langle dimension \ expression \rangle$ .

TeXhackers note: This is the TeX primitive \ht.

\box\_wd:c Calculates the width of the  $\langle box \rangle$  in a form suitable for use in a  $\langle dimension \ expression \rangle$ .

TFXhackers note: This is the TFX primitive \wd.

 $\verb|\box_set_dp:Nn| \ \ \box_set_dp:Nn| \ \ \ \ \{\langle dimension| \ expression \rangle\}|$ 

\box\_set\_dp:cn G

Set the depth (below the baseline) of the  $\langle box \rangle$  to the value of the  $\{\langle dimension \ Updated: 2011-10-22 \ expression \rangle\}$ . This is a global assignment.

 $\verb|\box_set_ht:Nn| \ \ \box_set_ht:Nn| \ \ \ \ \{\langle dimension| expression\rangle\}|$ 

\box\_set\_ht:cn Updated: 2011-10-22

Set the height (above the baseline) of the  $\langle box \rangle$  to the value of the  $\{\langle dimension expression \rangle\}$ . This is a global assignment.

\box\_set\_wd:Nn

\box\_set\_wd:Nn \langle box \rangle \langle dimension expression \rangle \rangle

Set the width of the  $\langle box \rangle$  to the value of the  $\{\langle dimension \ expression \rangle\}$ . This is a global assignment.

# 4 Box conditionals

```
\box_if_empty_p:N $$ \box_if_empty_p:C $$ \box_if_empty:NTF $$ \box_if_empty:NTF $$ \box_if_empty:CTF $$ $$ $$ \box_if_empty:CTF $$ \box_if_empty:CT
```

```
\box_if_horizontal_p:N $$ \box_if_horizontal_p:N $$ \box_if_horizontal:NTF $$ \box_if_horizont
```

```
\box_if_vertical_p:N \star \box_if_vertical_p:N \langle box \rangle \\ \box_if_vertical_p:c \star \box_if_vertical:NTF \langle box \rangle \{\langle true\ code \rangle\} \{\langle false\ code \rangle\} \\ \box_if_vertical:NTF \star \box_if_vertical:NTF \star \box_if_vertical\} \\ \box_if_vertical:NTF \star \box_if_vertical box.
```

\box\_if\_vertical:c<u>TF</u> \*

#### The last box inserted 5

\box\_set\_to\_last:N \box\_set\_to\_last:c \box\_gset\_to\_last:N \box\_gset\_to\_last:c  $\box_set_to_last:N \langle box \rangle$ 

Sets the  $\langle box \rangle$  equal to the last item (box) added to the current partial list, removing the item from the list at the same time. When applied to the main vertical list, the  $\langle box \rangle$ will always be void as it is not possible to recover the last added item.

#### 6 Constant boxes

\c\_empty\_box Updated: 2012-11-04 This is a permanently empty box, which is neither set as horizontal nor vertical.

#### Scratch boxes 7

\l\_tmpa\_box \l\_tmpb\_box

Updated: 2012-11-04

Scratch boxes for local assignment. These are never used by the kernel code, and so are safe for use with any IATEX3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.

\g\_tmpa\_box \g\_tmpb\_box Scratch boxes for global assignment. These are never used by the kernel code, and so are safe for use with any LATEX3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.

#### 8 Viewing box contents

\box\_show:N

\box\_show:c

 $\box_show:N \langle box \rangle$ 

Shows full details of the content of the  $\langle box \rangle$  in the terminal.

Updated: 2012-05-11

\box\_show:Nnn

 $\box_show:Nnn \langle box \rangle \langle intexpr_1 \rangle \langle intexpr_2 \rangle$ 

\box\_show:cnn

Display the contents of  $\langle box \rangle$  in the terminal, showing the first  $\langle intexpr_1 \rangle$  items of the

New: 2012-05-11

box, and descending into  $\langle intexpr_2 \rangle$  group levels.

\box\_log:N

\box\_log:N \langle box \rangle

\box\_log:c

Writes full details of the content of the  $\langle box \rangle$  to the log.

New: 2012-05-11

\box\_log:Nnn \box\_log:cnn  $\text{box\_log:Nnn } \langle box \rangle \langle intexpr_1 \rangle \langle intexpr_2 \rangle$ 

New: 2012-05-11

Writes the contents of  $\langle box \rangle$  to the log, showing the first  $\langle intexpr_1 \rangle$  items of the box, and descending into  $\langle intexpr_2 \rangle$  group levels.

### 9 Horizontal mode boxes

\hbox:n

\hbox:n {\(\langle contents \rangle \rangle \)

Typesets the  $\langle contents \rangle$  into a horizontal box of natural width and then includes this box in the current list for typesetting.

\hbox\_to\_wd:nn

 $\begin{tabular}{ll} $$ \begin{tabular}{ll} $$ (dimexpr) & (contents) \\ \end{tabular}$ 

Typesets the  $\langle contents \rangle$  into a horizontal box of width  $\langle dimexpr \rangle$  and then includes this box in the current list for typesetting.

\hbox\_to\_zero:n

 $\begin{tabular}{ll} $$ \begin{tabular}{ll} $$ \begin{tabular}{ll} $$ & (contents)$ \end{tabular} \end{tabular}$ 

Typesets the  $\langle contents \rangle$  into a horizontal box of zero width and then includes this box in the current list for typesetting.

\hbox\_set:Nn

 $\begin{tabular}{ll} \textbf{hbox\_set:Nn} & \langle box \rangle & \{\langle contents \rangle\} \\ \end{tabular}$ 

\hbox\_set:cn
\hbox\_gset:Nn
\hbox\_gset:cn

Typesets the  $\langle contents \rangle$  at natural width and then stores the result inside the  $\langle box \rangle$ .

\hbox\_set\_to\_wd:Nnn
\hbox\_set\_to\_wd:cnn
\hbox\_gset\_to\_wd:Nnn
\hbox\_gset\_to\_wd:cnn

 $\label{local_set_to_wd:Nnn} $$ \box_{contents} \ {\contents} $$$ 

Typesets the  $\langle contents \rangle$  to the width given by the  $\langle dimexpr \rangle$  and then stores the result inside the  $\langle box \rangle$ .

\hbox\_overlap\_right:n

\hbox\_overlap\_right:n {\langle contents \rangle}

Typesets the  $\langle contents \rangle$  into a horizontal box of zero width such that material will protrude to the right of the insertion point.

\hbox\_overlap\_left:n

 $\verb|\hbox_overlap_left:n {| \langle contents \rangle|}$ 

Typesets the  $\langle contents \rangle$  into a horizontal box of zero width such that material will protrude to the left of the insertion point.

\hbox\_set:Nw
\hbox\_set:cw
\hbox\_set\_end:
\hbox\_gset:Nw
\hbox\_gset:cw
\hbox\_gset\_end:

 $\verb|\hbox_set:Nw| \langle box \rangle | \langle contents \rangle | \verb|\hbox_set_end:|$ 

Typesets the  $\langle contents \rangle$  at natural width and then stores the result inside the  $\langle box \rangle$ . In contrast to  $\hbox_set: \normalfont{Nn}$  this function does not absorb the argument when finding the  $\langle content \rangle$ , and so can be used in circumstances where the  $\langle content \rangle$  may not be a simple argument.

\hbox\_unpack:N\hbox\_unpack:c

 $\hox_unpack: N \langle box \rangle$ 

Unpacks the content of the horizontal  $\langle box \rangle$ , retaining any stretching or shrinking applied when the  $\langle box \rangle$  was set.

TEXhackers note: This is the TEX primitive \unhcopy.

\hbox\_unpack\_clear:N\hbox\_unpack\_clear:c

\hbox\_unpack\_clear:N \langle box \rangle

Unpacks the content of the horizontal  $\langle box \rangle$ , retaining any stretching or shrinking applied when the  $\langle box \rangle$  was set. The  $\langle box \rangle$  is then cleared globally.

TEXhackers note: This is the TEX primitive \unhbox.

### 10 Vertical mode boxes

Vertical boxes inherit their baseline from their contents. The standard case is that the baseline of the box is at the same position as that of the last item added to the box. This means that the box will have no depth unless the last item added to it had depth. As a result most vertical boxes have a large height value and small or zero depth. The exception are \_top boxes, where the reference point is that of the first item added. These tend to have a large depth and small height, although the latter will typically be non-zero.

\vbox:n

\vbox:n {\langle contents \rangle}

Updated: 2011-12-18

Typesets the  $\langle contents \rangle$  into a vertical box of natural height and includes this box in the current list for typesetting.

TEXhackers note: This is the TEX primitive \vbox.

\vbox\_top:n

 $\verb|\vbox_top:n {|} \langle contents \rangle \}$ 

Updated: 2011-12-18

Typesets the  $\langle contents \rangle$  into a vertical box of natural height and includes this box in the current list for typesetting. The baseline of the box will be equal to that of the *first* item added to the box.

TEXhackers note: This is the TEX primitive \vtop.

\vbox\_to\_ht:nn

 $\width \begin{tabular}{ll} $$ \width \begin{tabular}{ll} $\langle contents \rangle$ & $\langle contents \rangle$$ 

Updated: 2011-12-18

Typesets the  $\langle contents \rangle$  into a vertical box of height  $\langle dimexpr \rangle$  and then includes this box in the current list for typesetting.

\vbox\_to\_zero:n

 $\\vert vbox\_to\_zero:n \{\langle contents \rangle\}$ 

Updated: 2011-12-18

Typesets the  $\langle contents \rangle$  into a vertical box of zero height and then includes this box in the current list for typesetting.

\vbox\_set:Nn

 $\\vert Nn \ \langle box \rangle \ \{\langle contents \rangle\}$ 

\vbox\_set:cn \vbox\_gset:Nn

Typesets the  $\langle contents \rangle$  at natural height and then stores the result inside the  $\langle box \rangle$ .

\vbox\_gset:cn

Updated: 2011-12-18

\vbox\_set\_top:Nn

 $\begin{tabular}{ll} \verb&\vbox_set_top:Nn & $\langle box \rangle$ & {\langle contents \rangle}$ \\ \end{tabular}$ 

\vbox\_set\_top:cn \vbox\_gset\_top:Nn

Typesets the  $\langle contents \rangle$  at natural height and then stores the result inside the  $\langle box \rangle$ . The baseline of the box will be equal to that of the first item added to the box.

\vbox\_gset\_top:cn Updated: 2011-12-18

\vbox\_set\_to\_ht:Nnn

\vbox\_set\_to\_ht:cnn \vbox\_gset\_to\_ht:Nnn \vbox\_gset\_to\_ht:cnn Typesets the  $\langle contents \rangle$  to the height given by the  $\langle dimexpr \rangle$  and then stores the result inside the  $\langle box \rangle$ .

Updated: 2011-12-18

\vbox\_set:Nw \vbox\_set:cw

\vbox\_set\_end: \vbox\_gset:Nw \vbox\_gset:cw

\vbox\_gset\_end: Updated: 2011-12-18

\vbox\_set:Nw \langle box \langle contents \vbox\_set\_end:

Typesets the  $\langle contents \rangle$  at natural height and then stores the result inside the  $\langle box \rangle$ . In contrast to \vbox set:Nn this function does not absorb the argument when finding the  $\langle content \rangle$ , and so can be used in circumstances where the  $\langle content \rangle$  may not be a simple argument.

\vbox\_set\_split\_to\_ht:NNn

 $\verb|\vbox_set_split_to_ht:NNn| \langle box_1 \rangle | \langle box_2 \rangle | \{\langle dimexpr \rangle\}|$ 

Updated: 2011-10-22

Sets  $\langle box_1 \rangle$  to contain material to the height given by the  $\langle dimexpr \rangle$  by removing content from the top of  $\langle box_2 \rangle$  (which must be a vertical box).

TEXhackers note: This is the TEX primitive \vsplit.

\vbox\_unpack:N

\vbox\_unpack:c

Unpacks the content of the vertical  $\langle box \rangle$ , retaining any stretching or shrinking applied when the  $\langle box \rangle$  was set.

TEXhackers note: This is the TEX primitive \unvcopy.

\vbox\_unpack\_clear:N

\vbox\_unpack\_clear:c

Unpacks the content of the vertical  $\langle box \rangle$ , retaining any stretching or shrinking applied when the  $\langle box \rangle$  was set. The  $\langle box \rangle$  is then cleared globally.

TEXhackers note: This is the TEX primitive \unvbox.

# 11 Primitive box conditionals

```
\if_hbox:N \langle box \rangle
       \if_hbox:N *
                                 ⟨true code⟩
                              \else:
                                 ⟨false code⟩
                              \fi:

# Part XVII

# The **I3coffins** package Coffin code layer

The material in this module provides the low-level support system for coffins. For details about the design concept of a coffin, see the xcoffins module (in the l3experimental bundle).

#### Creating and initialising coffins 1

\coffin\_new:N \coffin\_new:c

New: 2011-08-17

\coffin\_new:N \( coffin \)

Creates a new  $\langle coffin \rangle$  or raises an error if the name is already taken. The declaration is global. The  $\langle coffin \rangle$  will initially be empty.

\coffin\_clear:N

\coffin\_clear:c

New: 2011-08-17

\coffin\_clear:N \( coffin \)

Clears the content of the  $\langle coffin \rangle$  within the current T<sub>F</sub>X group level.

\coffin\_set\_eq:NN \coffin\_set\_eq:(Nc|cN|cc)

New: 2011-08-17

 $\coffin\_set\_eq:NN \langle coffin_1 \rangle \langle coffin_2 \rangle$ 

Sets both the content and poles of  $\langle coffin_1 \rangle$  equal to those of  $\langle coffin_2 \rangle$  within the current TfX group level.

\coffin\_if\_exist\_p:N \* \coffin\_if\_exist\_p:c \* \coffin\_if\_exist:NTF \* \coffin\_if\_exist:cTF \*

```
\coffin_if_exist_p:N \langle box \rangle
\coffin_if_exist:NTF \langle box \rangle \{\langle true \ code \rangle\} \{\langle false \ code \rangle\}
```

Tests whether the  $\langle coffin \rangle$  is currently defined.

New: 2012-06-20

#### 2 Setting coffin content and poles

All coffin functions create and manipulate coffins locally within the current TEX group level.

\hcoffin\_set:Nn \hcoffin\_set:cn

New: 2011-08-17

Updated: 2011-09-03

 $\hcoffin_set:Nn \langle coffin \rangle \{\langle material \rangle\}$ 

Typesets the  $\langle material \rangle$  in horizontal mode, storing the result in the  $\langle coffin \rangle$ . The standard poles for the  $\langle coffin \rangle$  are then set up based on the size of the typeset material.

\hcoffin\_set:Nw
\hcoffin\_set:cw
\hcoffin\_set\_end:

 $\verb|\hcoffin_set:Nw| & \langle coffin \rangle & \langle material \rangle & \land hcoffin_set_end:$ 

New: 2011-09-10

Typesets the  $\langle material \rangle$  in horizontal mode, storing the result in the  $\langle coffin \rangle$ . The standard poles for the  $\langle coffin \rangle$  are then set up based on the size of the typeset material. These functions are useful for setting the entire contents of an environment in a coffin.

\vcoffin\_set:Nnn
\vcoffin\_set:cnn

 $\verb|\vcoffin_set:Nnn| \langle coffin \rangle | \{\langle width \rangle\} | \{\langle material \rangle\}|$ 

New: 2011-08-17 Updated: 2012-05-22 Typesets the  $\langle material \rangle$  in vertical mode constrained to the given  $\langle width \rangle$  and stores the result in the  $\langle coffin \rangle$ . The standard poles for the  $\langle coffin \rangle$  are then set up based on the size of the typeset material.

\vcoffin\_set:Nnw
\vcoffin\_set:cnw
\vcoffin\_set\_end:

 $\label{localization} $$\operatorname{vcoffin_set:Nnw} \ \langle \operatorname{coffin} \rangle \ \langle \operatorname{material} \rangle \ \operatorname{vcoffin_set\_end:} $$$ 

New: 2011-09-10 size of the ty
Updated: 2012-05-22 an environment

Typesets the  $\langle material \rangle$  in vertical mode constrained to the given  $\langle width \rangle$  and stores the result in the  $\langle coffin \rangle$ . The standard poles for the  $\langle coffin \rangle$  are then set up based on the size of the typeset material. These functions are useful for setting the entire contents of an environment in a coffin.

\coffin\_set\_horizontal\_pole:Nnn
\coffin\_set\_horizontal\_pole:cnn

\coffin\_set\_horizontal\_pole:Nnn \langle coffin \\
{\langle pole \rangle } \langle \langle offset \rangle \rangle

New: 2012-07-20

Sets the  $\langle pole \rangle$  to run horizontally through the  $\langle coffin \rangle$ . The  $\langle pole \rangle$  will be located at the  $\langle offset \rangle$  from the bottom edge of the bounding box of the  $\langle coffin \rangle$ . The  $\langle offset \rangle$  should be given as a dimension expression.

\coffin\_set\_vertical\_pole:Nnn
\coffin\_set\_vertical\_pole:cnn

 $\verb|\coffin_set_vertical_pole:Nnn| & \langle coffin \rangle | \{\langle pole \rangle\} | \{\langle offset \rangle\}|$ 

New: 2012-07-20

Sets the  $\langle pole \rangle$  to run vertically through the  $\langle coffin \rangle$ . The  $\langle pole \rangle$  will be located at the  $\langle offset \rangle$  from the left-hand edge of the bounding box of the  $\langle coffin \rangle$ . The  $\langle offset \rangle$  should be given as a dimension expression.

# 3 Joining and using coffins

This function attaches  $\langle coffin_2 \rangle$  to  $\langle coffin_1 \rangle$  such that the bounding box of  $\langle coffin_1 \rangle$  is not altered, i.e.  $\langle coffin_2 \rangle$  can protrude outside of the bounding box of the coffin. The alignment is carried out by first calculating  $\langle handle_1 \rangle$ , the point of intersection of  $\langle coffin_1 \text{-}pole_1 \rangle$  and  $\langle coffin_1 \text{-}pole_2 \rangle$ , and  $\langle handle_2 \rangle$ , the point of intersection of  $\langle coffin_2 \text{-}pole_1 \rangle$  and  $\langle coffin_2 \text{-}pole_2 \rangle$ .  $\langle coffin_2 \rangle$  is then attached to  $\langle coffin_1 \rangle$  such that the relationship between  $\langle handle_1 \rangle$  and  $\langle handle_2 \rangle$  is described by the  $\langle x\text{-}offset \rangle$  and  $\langle y\text{-}offset \rangle$ . The two offsets should be given as dimension expressions.

This function joins  $\langle coffin_2 \rangle$  to  $\langle coffin_1 \rangle$  such that the bounding box of  $\langle coffin_1 \rangle$  may expand. The new bounding box will cover the area containing the bounding boxes of the two original coffins. The alignment is carried out by first calculating  $\langle handle_1 \rangle$ , the point of intersection of  $\langle coffin_1 \text{-} pole_1 \rangle$  and  $\langle coffin_1 \text{-} pole_2 \rangle$ , and  $\langle handle_2 \rangle$ , the point of intersection of  $\langle coffin_2 \text{-} pole_1 \rangle$  and  $\langle coffin_2 \text{-} pole_2 \rangle$ .  $\langle coffin_2 \rangle$  is then attached to  $\langle coffin_1 \rangle$  such that the relationship between  $\langle handle_1 \rangle$  and  $\langle handle_2 \rangle$  is described by the  $\langle x\text{-} offset \rangle$  and  $\langle y\text{-} offset \rangle$ . The two offsets should be given as dimension expressions.

```
\coffin_typeset:Nnnnn
\coffin_typeset:cnnnn
```

```
\label{localization} $$ \operatorname{coffin}_{\operatorname{typeset}} \mathbb{\{}\langle \operatorname{pole}_1\rangle \mathbb{\}} \mathbb{\{}\langle \operatorname{pole}_2\rangle \mathbb{\}} \mathbb{\{}\langle \operatorname{x-offset}\rangle \mathbb{\}} $$
```

Updated: 2012-07-20

Typesetting is carried out by first calculating  $\langle handle \rangle$ , the point of intersection of  $\langle pole_1 \rangle$  and  $\langle pole_2 \rangle$ . The coffin is then typeset in horizontal mode such that the relationship between the current reference point in the document and the  $\langle handle \rangle$  is described by the  $\langle x\text{-}offset \rangle$  and  $\langle y\text{-}offset \rangle$ . The two offsets should be given as dimension expressions. Typesetting a coffin is therefore analogous to carrying out an alignment where the "parent" coffin is the current insertion point.

# 4 Measuring coffins

\coffin\_dp:N
\coffin\_dp:c

```
\coffin_dp:N \( coffin \)
```

Calculates the depth (below the baseline) of the  $\langle coffin \rangle$  in a form suitable for use in a  $\langle dimension \; expression \rangle$ .

\coffin\_ht:N

\coffin\_ht:N \(\langle coffin \rangle \)

\coffin\_ht:c

Calculates the height (above the baseline) of the  $\langle coffin \rangle$  in a form suitable for use in a  $\langle dimension \ expression \rangle$ .

\coffin\_wd:N

\coffin\_wd:N \(coffin\)

\coffin\_wd:c

Calculates the width of the  $\langle coffin \rangle$  in a form suitable for use in a  $\langle dimension \ expression \rangle$ .

# 5 Coffin diagnostics

 $\verb|\coffin_display_handles:Nn| \\$ 

 $\coffin_display_handles:Nn \langle coffin \rangle \{\langle color \rangle\}$ 

\coffin\_display\_handles:cn

Updated: 2011-09-02

This function first calculates the intersections between all of the  $\langle poles \rangle$  of the  $\langle coffin \rangle$  to give a set of  $\langle handles \rangle$ . It then prints the  $\langle coffin \rangle$  at the current location in the source, with the position of the  $\langle handles \rangle$  marked on the coffin. The  $\langle handles \rangle$  will be labelled as part of this process: the locations of the  $\langle handles \rangle$  and the labels are both printed in the  $\langle color \rangle$  specified.

\coffin\_mark\_handle:Nnnn
\coffin\_mark\_handle:cnnn

 $\verb|\coffin_mark_handle:Nnnn| | \langle coffin \rangle | \{\langle pole_1 \rangle\} | \{\langle pole_2 \rangle\} | \{\langle color \rangle\}|$ 

Updated: 2011-09-02

This function first calculates the  $\langle handle \rangle$  for the  $\langle coffin \rangle$  as defined by the intersection of  $\langle pole_1 \rangle$  and  $\langle pole_2 \rangle$ . It then marks the position of the  $\langle handle \rangle$  on the  $\langle coffin \rangle$ . The  $\langle handle \rangle$  will be labelled as part of this process: the location of the  $\langle handle \rangle$  and the label are both printed in the  $\langle color \rangle$  specified.

\coffin\_show\_structure:N
\coffin\_show\_structure:c

\coffin\_show\_structure:N \( \coffin \)

Updated: 2015-08-01

This function shows the structural information about the  $\langle coffin \rangle$  in the terminal. The width, height and depth of the typeset material are given, along with the location of all of the poles of the coffin.

Notice that the poles of a coffin are defined by four values: the x and y co-ordinates of a point that the pole passes through and the x- and y-components of a vector denoting the direction of the pole. It is the ratio between the later, rather than the absolute values, which determines the direction of the pole.

#### 5.1 Constants and variables

 $\c_{empty\_coffin}$ 

A permanently empty coffin.

\l\_tmpa\_coffin
\l\_tmpb\_coffin

New: 2012-06-19

Scratch coffins for local assignment. These are never used by the kernel code, and so are safe for use with any LATEX3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.

# Part XVIII

# The **I3color** package Color support

This module provides support for color in LATEX3. At present, the material here is mainly intended to support a small number of low-level requirements in other l3kernel modules.

# 1 Color in boxes

Controlling the color of text in boxes requires a small number of control functions, so that the boxed material uses the color at the point where it is set, rather than where it is used.

\color\_group\_begin:
\color\_group\_end:

\color\_group\_begin:

• • •

New: 2011-09-03

\color\_group\_end:

Creates a color group: one used to "trap" color settings.

\color\_ensure\_current:

\color\_ensure\_current:

New: 2011-09-03

Ensures that material inside a box will use the foreground color at the point where the box is set, rather than that in force when the box is used. This function should usually be used within a \color\_group\_begin: ...\color\_group\_end: group.

# Part XIX

# The I3msg package

# Messages

Messages need to be passed to the user by modules, either when errors occur or to indicate how the code is proceeding. The l3msg module provides a consistent method for doing this (as opposed to writing directly to the terminal or log).

The system used by l3msg to create messages divides the process into two distinct parts. Named messages are created in the first part of the process; at this stage, no decision is made about the type of output that the message will produce. The second part of the process is actually producing a message. At this stage a choice of message class has to be made, for example error, warning or info.

By separating out the creation and use of messages, several benefits are available. First, the messages can be altered later without needing details of where they are used in the code. This makes it possible to alter the language used, the detail level and so on. Secondly, the output which results from a given message can be altered. This can be done on a message class, module or message name basis. In this way, message behaviour can be altered and messages can be entirely suppressed.

# 1 Creating new messages

All messages have to be created before they can be used. The text of messages will automatically by wrapped to the length available in the console. As a result, formatting is only needed where it will help to show meaning. In particular,  $\$  may be used to force a new line and  $\$  forces an explicit space. Additionally,  $\$ ,  $\$ ,  $\$ ,  $\$  and  $\$  can be used to produce the corresponding character.

Messages may be subdivided by one level using the / character. This is used within the message filtering system to allow for example the LATEX kernel messages to belong to the module LaTeX while still being filterable at a more granular level. Thus for example

```
\msg_new:nnnn { mymodule } { submodule / message } ...
```

will allow only those messages from the submodule to be filtered out.

\msg\_new:nnn
\msg\_new:nnn

Updated: 2011-08-16

 $\label{lem:msg_new:nnnn} $$\max_{n\in\mathbb{N}} {\langle module \rangle} {\langle message \rangle} {\langle text \rangle} {\langle more\ text \rangle}$$ 

Creates a  $\langle message \rangle$  for a given  $\langle module \rangle$ . The message will be defined to first give  $\langle text \rangle$  and then  $\langle more\ text \rangle$  if the user requests it. If no  $\langle more\ text \rangle$  is available then a standard text is given instead. Within  $\langle text \rangle$  and  $\langle more\ text \rangle$  four parameters (#1 to #4) can be used: these will be supplied at the time the message is used. An error will be raised if the  $\langle message \rangle$  already exists.

\msg\_set:nnnn
\msg\_set:nnn
\msg\_gset:nnnn
\msg\_gset:nnnn

```
\label{eq:msg_set:nnnn} $$\max_{set:nnnn} {\langle module \rangle} {\langle message \rangle} {\langle text \rangle} {\langle more\ text \rangle}$
```

Sets up the text for a  $\langle message \rangle$  for a given  $\langle module \rangle$ . The message will be defined to first give  $\langle text \rangle$  and then  $\langle more\ text \rangle$  if the user requests it. If no  $\langle more\ text \rangle$  is available then a standard text is given instead. Within  $\langle text \rangle$  and  $\langle more\ text \rangle$  four parameters (#1 to #4) can be used: these will be supplied at the time the message is used.

 $\label{eq:msg_if_exist_p:nn} $$ \msg_if_exist:nn$$ $\underline{TF} $$ $$$ 

```
\label{lem:msg_if_exist_p:nn} $$\max_{if_exist:nnTF {\langle module \rangle} {\langle message \rangle} {\langle true\ code \rangle} {\langle false\ code \rangle} $$
```

New: 2012-03-03

Tests whether the  $\langle message \rangle$  for the  $\langle module \rangle$  is currently defined.

# 2 Contextual information for messages

\msg\_line\_context:

\msg\_line\_context:

Prints the current line number when a message is given, and thus suitable for giving context to messages. The number itself is proceeded by the text on line.

\msg\_line\_number:

\msg\_line\_number:

Prints the current line number when a message is given.

\msg\_fatal\_text:n

 $\mbox{msg\_fatal\_text:n } {\mbox{module}}$ 

Produces the standard text

Fatal (module) error

This function can be redefined to alter the language in which the message is given, using #1 as the name of the  $\langle module \rangle$  to be included.

\msg\_critical\_text:n \*

 $\mbox{\mbox{$\mbox{msg\_critical\_text:n} {\mbox{$\mbox{}\mbox{$\$ 

Produces the standard text

Critical (module) error

This function can be redefined to alter the language in which the message is given, using #1 as the name of the  $\langle module \rangle$  to be included.

\msg\_error\_text:n \*

\msg\_error\_text:n {\( module \) \}

Produces the standard text

⟨module⟩ error

This function can be redefined to alter the language in which the message is given, using #1 as the name of the  $\langle module \rangle$  to be included.

\msg\_warning\_text:n

```
\msg_warning_text:n {\langle module \rangle}
```

Produces the standard text

```
⟨module⟩ warning
```

This function can be redefined to alter the language in which the message is given, using #1 as the name of the  $\langle module \rangle$  to be included.

\msg\_info\_text:n  $\star$ 

```
\mbox{msg\_info\_text:n } {\mbox{module}}
```

Produces the standard text:

```
⟨module⟩ info
```

This function can be redefined to alter the language in which the message is given, using #1 as the name of the  $\langle module \rangle$  to be included.

\msg\_see\_documentation\_text:n \*

```
\mbox{\sc msg_see\_documentation\_text:n } {\mbox{\sc module}}
```

Produces the standard text

```
See the \langle module \rangle documentation for further information.
```

This function can be redefined to alter the language in which the message is given, using #1 as the name of the  $\langle module \rangle$  to be included.

#### 3 Issuing messages

Messages behave differently depending on the message class. In all cases, the message may be issued supplying 0 to 4 arguments. If the number of arguments supplied here does not match the number in the definition of the message, extra arguments will be ignored, or empty arguments added (of course the sense of the message may be impaired). The four arguments will be converted to strings before being added to the message text: the x-type variants should be used to expand material.

\msg\_fatal:nnnnn \msg\_fatal:nnxxxx \msg\_fatal:nnnnn \msg\_fatal:nnxxx

 $\label{localization} $$\max_{\text{fatal:nnnnn}} {\langle module \rangle} {\langle message \rangle} {\langle arg one \rangle} {\langle arg two \rangle} {\langle arg three \rangle} $$$  $\{\langle arg four \rangle\}$ 

\msg\_fatal:nnnn \msg\_fatal:nnxx

\msg\_fatal:nnn

\msg\_fatal:nnx \msg\_fatal:nn

Updated: 2012-08-11

Issues  $\langle module \rangle$  error  $\langle message \rangle$ , passing  $\langle arg\ one \rangle$  to  $\langle arg\ four \rangle$  to the text-creating functions. After issuing a fatal error the TFX run will halt.

\msg\_critical:nnnnn \msg\_critical:nnxxxx \msg\_critical:nnnnn \msg\_critical:nnxxx \msg\_critical:nnnn \msg\_critical:nnxx \msg\_critical:nnn \msg\_critical:nnx \msg\_critical:nn

 $\label{eq:msg_critical:nnnnn} $$ \module \ {\module} \ {\module} \ {\module} \ {\module} \ {\module} \ $$$  $\{\langle arg four \rangle\}$ 

Issues  $\langle module \rangle$  error  $\langle message \rangle$ , passing  $\langle arg\ one \rangle$  to  $\langle arg\ four \rangle$  to the text-creating functions. After issuing a critical error, T<sub>F</sub>X will stop reading the current input file. This may halt the T<sub>F</sub>X run (if the current file is the main file) or may abort reading a sub-file.

TEXhackers note: The TEX \endinput primitive is used to exit the file. In particular, the rest of the current line remains in the input stream.

\label{lem:msg_none:nnnnn} $$ \mbox{module} \ {\mbox{message}}  \ {\mbox{arg one}}  \ {\mbox{arg two}}  \ {\mbox{arg three}}  \ {\mbox{darg three}}
```

Does nothing: used as a message class to prevent any output at all (see the discussion of message redirection).

Updated: 2012-08-11

# 4 Redirecting messages

Each message has a "name", which can be used to alter the behaviour of the message when it is given. Thus we might have

```
\msg_new:nnnn { module } { my-message } { Some~text } { Some~more~text }
to define a message, with
```

```
\msg_error:nn { module } { my-message }
```

when it is used. With no filtering, this will raise an error. However, we could alter the behaviour with

```
\msg_redirect_class:nn { error } { warning }

to turn all errors into warnings, or with
  \msg_redirect_module:nnn { module } { error } { warning }

to alter only messages from that module, or even
  \msg_redirect_name:nnn { module } { my-message } { warning }
```

to target just one message. Redirection applies first to individual messages, then to messages from one module and finally to messages of one class. Thus it is possible to select out an individual message for special treatment even if the entire class is already redirected.

Multiple redirections are possible. Redirections can be cancelled by providing an empty argument for the target class. Redirection to a missing class will raise errors immediately. Infinite loops are prevented by eliminating the redirection starting from the target of the redirection that caused the loop to appear. Namely, if redirections are requested as  $A \to B$ ,  $B \to C$  and  $C \to A$  in this order, then the  $A \to B$  redirection is cancelled.

\msg\_redirect\_class:nn

 $\mbox{msg\_redirect\_class:nn } {\langle class \ one \rangle} {\langle class \ two \rangle}$ 

Updated: 2012-04-27

Changes the behaviour of messages of  $\langle class \ one \rangle$  so that they are processed using the code for those of  $\langle class \ two \rangle$ .

\msg\_redirect\_module:nnn

 $\mbox{msg\_redirect\_module:nnn } {\langle module \rangle} {\langle class one \rangle} {\langle class two \rangle}$ 

Updated: 2012-04-27

Redirects message of  $\langle class\ one \rangle$  for  $\langle module \rangle$  to act as though they were from  $\langle class\ two \rangle$ . Messages of  $\langle class\ one \rangle$  from sources other than  $\langle module \rangle$  are not affected by this redirection. This function can be used to make some messages "silent" by default. For example, all of the warning messages of  $\langle module \rangle$  could be turned off with:

\msg\_redirect\_module:nnn { module } { warning } { none }

\msg\_redirect\_name:nnn

 $\label{local_mag_redirect_name:nnn} $$\max_{redirect_name:nnn {\langle module \rangle} {\langle message \rangle} {\langle class \rangle}$}$ 

Updated: 2012-04-27

Redirects a specific  $\langle message \rangle$  from a specific  $\langle module \rangle$  to act as a member of  $\langle class \rangle$  of messages. No further redirection is performed. This function can be used to make a selected message "silent" without changing global parameters:

\msg\_redirect\_name:nnn { module } { annoying-message } { none }

# 5 Low-level message functions

The lower-level message functions should usually be accessed from the higher-level system. However, there are occasions where direct access to these functions is desirable.

\msg\_interrupt:nnn

 $\label{line} $$ \msg_interrupt:nnn {$\langle first \; line \rangle$} {\langle text \rangle} {\langle extra \; text \rangle}$$ 

New: 2012-06-28

Interrupts the TeX run, issuing a formatted message comprising  $\langle first \ line \rangle$  and  $\langle text \rangle$  laid out in the format

where the  $\langle text \rangle$  will be wrapped to fit within the current line length. The user may then request more information, at which stage the  $\langle extra\ text \rangle$  will be shown in the terminal in the format

where the  $\langle extra\ text \rangle$  will be wrapped within the current line length. Wrapping of both  $\langle text \rangle$  and  $\langle more\ text \rangle$  takes place using \iow\_wrap:nnnN; the documentation for the latter should be consulted for full details.

\msg\_log:n

 $\mbox{msg_log:n } {\langle text \rangle}$ 

New: 2012-06-28

Writes to the log file with the  $\langle text \rangle$  laid out in the format

```
. <text>
```

where the  $\langle text \rangle$  will be wrapped to fit within the current line length. Wrapping takes place using \iow\_wrap:nnnN; the documentation for the latter should be consulted for full details.

\msg\_term:n

 $\mbox{msg\_term:n } {\langle text \rangle}$ 

New: 2012-06-28

Writes to the terminal and log file with the  $\langle text \rangle$  laid out in the format

where the  $\langle text \rangle$  will be wrapped to fit within the current line length. Wrapping takes place using \iow\_wrap:nnnN; the documentation for the latter should be consulted for full details.

# 6 Kernel-specific functions

Messages from LATEX3 itself are handled by the general message system, but have their own functions. This allows some text to be pre-defined, and also ensures that serious errors can be handled properly.

\\_\_msg\_kernel\_new:nnn
\\_\_msg\_kernel\_new:nnn

 $\verb|\__msg_kernel_new:nnnn| {\langle module \rangle} {\langle message \rangle} {\langle text \rangle} {\langle more\ text \rangle}$ 

Updated: 2011-08-16

Creates a kernel  $\langle message \rangle$  for a given  $\langle module \rangle$ . The message will be defined to first give  $\langle text \rangle$  and then  $\langle more\ text \rangle$  if the user requests it. If no  $\langle more\ text \rangle$  is available then a standard text is given instead. Within  $\langle text \rangle$  and  $\langle more\ text \rangle$  four parameters (#1 to #4) can be used: these will be supplied and expanded at the time the message is used. An error will be raised if the  $\langle message \rangle$  already exists.

\\_\_msg\_kernel\_set:nnnn \\_\_msg\_kernel\_set:nnn  $\label{lem:lemondule} $$\sum_{\text{emsg\_kernel\_set:nnnn}} {\langle module \rangle} {\langle message \rangle} {\langle text \rangle} {\langle more\ text \rangle}$$ 

Sets up the text for a kernel  $\langle message \rangle$  for a given  $\langle module \rangle$ . The message will be defined to first give  $\langle text \rangle$  and then  $\langle more\ text \rangle$  if the user requests it. If no  $\langle more\ text \rangle$  is available then a standard text is given instead. Within  $\langle text \rangle$  and  $\langle more\ text \rangle$  four parameters (#1 to #4) can be used: these will be supplied and expanded at the time the message is used.

\\_\_msg\_kernel\_fatal:nnnnnn
\\_\_msg\_kernel\_fatal:nnxxx
\\_\_msg\_kernel\_fatal:nnxxx
\\_\_msg\_kernel\_fatal:nnxx
\\_\_msg\_kernel\_fatal:nnxx
\\_\_msg\_kernel\_fatal:nnn
\\_\_msg\_kernel\_fatal:nnx
\\_\_msg\_kernel\_fatal:nnx

 $\label{lem:condition} $$\sum_{\ensuremath{\mbox{\mbox{$\sim$}}} {\ensuremath{\mbox{\mbox{$\sim$}}} {\ensuremath{\mbox{$\sim$}}} {\ensuremath{\mbox{$\sim$}}}} {\ensuremath{\mbox{$\sim$}}} {\ensuremath{\mbox{$\sim$}}}} {\ensuremath{\mbox{$\sim$}}} {\ensuremath{\mbox{$\sim$}}}} {\ensuremath{\mbox{$\sim$}}} {\ensuremath{\mbox{$\sim$}}} {$ 

Issues kernel  $\langle module \rangle$  error  $\langle message \rangle$ , passing  $\langle arg\ one \rangle$  to  $\langle arg\ four \rangle$  to the text-creating functions. After issuing a fatal error the T<sub>F</sub>X run will halt. Cannot be redirected.

Updated: 2012-08-11

\\_\_msg\_kernel\_error:nnnnnn
\\_\_msg\_kernel\_error:nnxxx
\\_\_msg\_kernel\_error:nnxxx
\\_\_msg\_kernel\_error:nnnn
\\_\_msg\_kernel\_error:nnxx
\\_\_msg\_kernel\_error:nnn
\\_\_msg\_kernel\_error:nnx
\\_\_msg\_kernel\_error:nnx

 $\label{lem:lemondule} $$ \sum_{e=0}^{\infty} {\langle arg one \rangle} {\langle arg two \rangle}$ 

Issues kernel  $\langle module \rangle$  error  $\langle message \rangle$ , passing  $\langle arg\ one \rangle$  to  $\langle arg\ four \rangle$  to the text-creating functions. The error will stop processing and issue the text at the terminal. After user input, the run will continue. Cannot be redirected.

Updated: 2012-08-11

Issues kernel  $\langle module \rangle$  warning  $\langle message \rangle$ , passing  $\langle arg\ one \rangle$  to  $\langle arg\ four \rangle$  to the text-creating functions. The warning text will be added to the log file, but the TeX run will not be interrupted.

```
\__msg_kernel_info:nnnnn
\__msg_kernel_info:nnxxx
\__msg_kernel_info:nnxxx
\__msg_kernel_info:nnxx
\__msg_kernel_info:nnxx
\__msg_kernel_info:nnn
\__msg_kernel_info:nnx
\__msg_kernel_info:nnx
```

\\_\_msg\_kernel\_info:nnnnnn { $\langle module \rangle$ } { $\langle message \rangle$ } { $\langle arg\ one \rangle$ } { $\langle arg\ two \rangle$ } { $\langle arg\ two \rangle$ } { $\langle arg\ two \rangle$ }

Issues kernel  $\langle module \rangle$  information  $\langle message \rangle$ , passing  $\langle arg\ one \rangle$  to  $\langle arg\ four \rangle$  to the text-creating functions. The information text will be added to the log file.

Updated: 2012-08-11

# 7 Expandable errors

In a few places, the LATEX3 kernel needs to produce errors in an expansion only context. This must be handled internally very differently from normal error messages, as none of the tools to print to the terminal or the log file are expandable. However, the interface is similar, with the important caveat that the message text and arguments are not expanded, and messages should be very short.

Issues an error, passing  $\langle arg\ one \rangle$  to  $\langle arg\ four \rangle$  to the text-creating functions. The resulting string must be shorter than a line, otherwise it will be cropped.

```
\_msg_expandable_error:n {\( \langle error \) message \( \rangle \)}
_msg_expandable_error:n 🖈
                  New: 2011-08-11
              Updated: 2011-08-13
```

Issues an "Undefined error" message from T<sub>F</sub>X itself, and prints the (error message). The  $\langle error \ message \rangle$  must be short: it is cropped at the end of one line.

TEXhackers note: This function expands to an empty token list after two steps. Tokens inserted in response to TEX's prompt are read with the current category code setting, and inserted just after the place where the error message was issued.

#### 8 Internal **I3msg** functions

The following functions are used in several kernel modules.

\_\_msg\_log\_next:

```
\__msg_log_next: \langle show-command \rangle
```

New: 2015-08-05

Causes the next  $\langle show\text{-}command \rangle$  to send its output to the log file instead of the terminal. This allows for instance \cs\_log:N to be defined as \\_\_msg\_log\_next: \cs\_show:N. The effect of this command lasts until the next use of \\_msg\_show\_wrap:Nn or \\_msg\_show wrap:n or \ msg show variable:NNNnn, in other words until the next time the  $\varepsilon$ -T<sub>F</sub>X primitive \showtokens would have been used for showing to the terminal or until the next variable-not-defined error.

```
\mbox{\colored} \mbox{\color
_msg_show_pre:nnnnnn
  _{	t msg\_show\_pre:(nnxxxx|nnnnnV)}
                                                                                                                                                                                                                                                                                                                                                                                                                                        {\langle arg three \rangle} {\langle arg four \rangle}
                                                                                                                                                                                                                                        New: 2015-08-05
```

Prints the \( \text{message} \) from \( \text{module} \) in the terminal (or log file if \\_\_msg\_log\_next: was issued) without formatting. Used in messages which print complex variable contents completely.

 $\_{\text{msg\_show\_variable}}$  NNNnn  $\langle variable \rangle$   $\langle if-exist \rangle$   $\langle if-empty \rangle$  { $\langle msg \rangle$ } { $\langle formatted \rangle$ }

\_msg\_show\_variable:NNNnn

content \} New: 2015-08-04

If the \(\lambda variable\rangle\) does not exist according to \(\lambda if-exist\rangle\) (typically \cs\_if\_exist:NTF) then throw an error and do nothing more. Otherwise, if  $\langle msq \rangle$  is not empty, display the message LaTeX/kernel/show- $\langle msg \rangle$  with \token\_to\_str:N  $\langle variable \rangle$  as a first argument, and a second argument that is ? or empty depending on the result of  $\langle if\text{-}empty\rangle$  (typically  $\t = if_empty:NTF)$  on the  $\langle variable \rangle$ . Then display the  $\langle formatted\ content \rangle$  by giving it as an argument to \ msg show wrap:n.

\\_\_msg\_show\_wrap:Nn

 $\verb|\__msg\_show\_wrap:Nn| \langle function \rangle | \{\langle expression \rangle\}|$ 

New: 2015-08-03 Updated: 2015-08-07 Shows or logs the  $\langle expression \rangle$  (turned into a string), an equal sign, and the result of applying the  $\langle function \rangle$  to the  $\{\langle expression \rangle\}$ . For instance, if the  $\langle function \rangle$  is  $\int_-eval:n$  and the  $\langle expression \rangle$  is 1+2 then this will log > 1+2=3. The case where the  $\langle function \rangle$  is  $\int_-to_str:n$  is special: then the string representation of the  $\langle expression \rangle$  is only logged once.

\\_\_msg\_show\_wrap:n

 $\_{msg\_show\_wrap:n} \{\langle formatted text \rangle\}$ 

New: 2015-08-03

Shows or logs the  $\langle formatted \ text \rangle$ . After expansion, unless it is empty, the  $\langle formatted \ text \rangle$  must contain >, and the part of  $\langle formatted \ text \rangle$  before the first > is removed. Failure to do so causes low-level T<sub>F</sub>X errors.

```
\__msg_show_item:n
\__msg_show_item:nn
\__msg_show_item_unbraced:nn
```

 $\_{msg\_show\_item:n} \langle item \rangle$   $\_{msg\_show\_item:nn} \langle item-key \rangle \langle item-value \rangle$ 

Updated: 2012-09-09

Auxiliary functions used within the last argument of \\_\_msg\_show\_variable:NNNnn or \\_\_msg\_show\_wrap:n to format variable items correctly for display. The \\_\_msg\_show\_-item:n version is used for simple lists, the \\_\_msg\_show\_item:nn and \\_\_msg\_show\_-item\_unbraced:nn versions for key-value like data structures.

\c\_\_msg\_coding\_error\_text\_tl

The text

This is a coding error.

used by kernel functions when erroneous programming input is encountered.

## Part XX

# The l3keys package Key-value interfaces

The key–value method is a popular system for creating large numbers of settings for controlling function or package behaviour. The system normally results in input of the form

```
\MyModuleSetup{
   key-one = value one,
   key-two = value two
}

or

\MyModuleMacro[
   key-one = value one,
   key-two = value two
]{argument}
```

for the user.

The high level functions here are intended as a method to create key–value controls. Keys are themselves created using a key–value interface, minimising the number of functions and arguments required. Each key is created by setting one or more *properties* of the key:

```
\keys_define:nn { mymodule }
    {
      key-one .code:n = code including parameter #1,
      key-two .tl_set:N = \l_mymodule_store_tl
    }
```

These values can then be set as with other key–value approaches:

```
\keys_set:nn { mymodule }
    {
       key-one = value one,
       key-two = value two
    }
```

At a document level,  $\ensuremath{\verb|keys_set:nn|}$  will be used within a document function, for example

```
\DeclareDocumentCommand \MyModuleSetup { m }
    { \keys_set:nn { mymodule } { #1 } }
\DeclareDocumentCommand \MyModuleMacro { o m }
    {
```

```
\group_begin:
  \keys_set:nn { mymodule } { #1 }
  % Main code for \MyModuleMacro
  \group_end:
}
```

Key names may contain any tokens, as they are handled internally using \t1\_to\_-str:n; spaces are *ignored* in key names. As will be discussed in section 2, it is suggested that the character / is reserved for sub-division of keys into logical groups. Functions and variables are *not* expanded when creating key names, and so

```
\tl_set:Nn \l_mymodule_tmp_tl { key }
\keys_define:nn { mymodule }
   {
     \l_mymodule_tmp_tl .code:n = code
}
```

will create a key called \l\_mymodule\_tmp\_tl, and not one called key.

## 1 Creating keys

\keys\_define:nn

```
\ensuremath{\mbox{keys\_define:nn } \{\langle module \rangle\} \ \{\langle keyval \ list \rangle\}}
```

Updated: 2015-11-07

Parses the  $\langle keyval \ list \rangle$  and defines the keys listed there for  $\langle module \rangle$ . The  $\langle module \rangle$  name should be a text value, but there are no restrictions on the nature of the text. In practice the  $\langle module \rangle$  should be chosen to be unique to the module in question (unless deliberately adding keys to an existing module).

The  $\langle keyval \ list \rangle$  should consist of one or more key names along with an associated key property. The properties of a key determine how it acts. The individual properties are described in the following text; a typical use of \keys\_define:nn might read

```
\keys_define:nn { mymodule }
    {
      keyname .code:n = Some~code~using~#1,
      keyname .value_required:n = true
   }
```

where the properties of the key begin from the . after the key name.

The various properties available take either no arguments at all, or require one or more arguments. This is indicated in the name of the property using an argument specification. In the following discussion, each property is illustrated attached to an arbitrary  $\langle key \rangle$ , which when used may be supplied with a  $\langle value \rangle$ . All key definitions are local.

Key properties are applied in the reading order and so the ordering is significant. Key properties which define "actions", such as .code:n, .tl\_set:N, etc., will override one another. Some other properties are mutually exclusive, notably .value\_required:n

and .value\_forbidden:n, and so will replace one another. However, properties covering non-exclusive behaviours may be given in any order. Thus for example the following defintions are equivalent.

Note that with the exception of the special .undefine: property, all key properties will define the key within the current TFX scope.

```
.bool_set:N
.bool_set:c
.bool_gset:N
.bool_gset:c
```

 $\langle key \rangle$  .bool\_set:N =  $\langle boolean \rangle$ 

Defines  $\langle key \rangle$  to set  $\langle boolean \rangle$  to  $\langle value \rangle$  (which must be either true or false). If the variable does not exist, it will be created globally at the point that the key is set up.

Updated: 2013-07-08

```
.bool_set_inverse:N
.bool_set_inverse:N
.bool_gset_inverse:C
.bool_gset_inverse:C
```

 $\langle key \rangle$  .bool\_set\_inverse:N =  $\langle boolean \rangle$ 

Defines  $\langle key \rangle$  to set  $\langle boolean \rangle$  to the logical inverse of  $\langle value \rangle$  (which must be either true or false). If the  $\langle boolean \rangle$  does not exist, it will be created globally at the point that the key is set up.

.choice:

New: 2011-08-28 Updated: 2013-07-08

 $\langle \texttt{key} \rangle$  .choice:

Sets  $\langle key \rangle$  to act as a choice key. Each valid choice for  $\langle key \rangle$  must then be created, as discussed in section 3.

```
.choices:nn
.choices:Vn
.choices:on
.choices:xn
```

```
\langle key \rangle .choices:nn = \{\langle choices \rangle\} \{\langle code \rangle\}
```

New: 2011-08-21 Updated: 2013-07-10

```
.clist_set:N
.clist_set:c
.clist_gset:N
.clist_gset:c
```

\langle key \rangle .clist\_set:N = \langle comma list variable \rangle

Defines  $\langle key \rangle$  to set  $\langle comma \ list \ variable \rangle$  to  $\langle value \rangle$ . Spaces around commas and empty items will be stripped. If the variable does not exist, it will be created globally at the point that the key is set up.

New: 2011-09-11

```
.code:n
```

 $\langle key \rangle$  .code:n =  $\{\langle code \rangle\}$ 

Updated: 2013-07-10

Stores the  $\langle code \rangle$  for execution when  $\langle key \rangle$  is used. The  $\langle code \rangle$  can include one parameter (#1), which will be the  $\langle value \rangle$  given for the  $\langle key \rangle$ . The x-type variant will expand  $\langle code \rangle$ at the point where the  $\langle key \rangle$  is created.

```
.default:n
.default:V
.default:o
.default:x
```

Updated: 2013-07-09

```
\langle key \rangle .default:n = \{\langle default \rangle\}
```

Creates a  $\langle default \rangle$  value for  $\langle key \rangle$ , which is used if no value is given. This will be used if only the key name is given, but not if a blank  $\langle value \rangle$  is given:

```
\keys define:nn { mymodule }
                   = Hello~#1,
   key .code:n
   key .default:n = World
\keys_set:nn { mymodule }
    key = Fred, % Prints 'Hello Fred'
                % Prints 'Hello World'
    key,
                % Prints 'Hello '
    key = ,
```

The default does not affect keys where values are required or forbidden. Thus a required value cannot be supplied by a default value, and giving a default value for a key which cannot take a value will not trigger an error.

```
.dim_set:N
```

 $\langle key \rangle$  .dim\_set:N =  $\langle dimension \rangle$ 

.dim\_set:c

Defines  $\langle key \rangle$  to set  $\langle dimension \rangle$  to  $\langle value \rangle$  (which must a dimension expression). If the variable does not exist, it will be created globally at the point that the key is set up.

.dim\_gset:N .dim\_gset:c

.fp\_set:c

\langle key \rangle .fp\_set:N = \langle floating point \rangle .fp\_set:N

.fp\_gset:N .fp\_gset:c Defines  $\langle key \rangle$  to set  $\langle floating\ point \rangle$  to  $\langle value \rangle$  (which must a floating point expression). If the variable does not exist, it will be created globally at the point that the key is set

```
.groups:n
```

```
\langle key \rangle .groups:n = \{\langle groups \rangle\}
```

New: 2013-07-14

Defines  $\langle key \rangle$  as belonging to the  $\langle groups \rangle$  declared. Groups provide a "secondary axis" for selectively setting keys, and are described in Section 6.

```
\langle key \rangle .initial:n = \{\langle value \rangle\}
  .initial:n
  .initial:V
                          Initialises the \langle key \rangle with the \langle value \rangle, equivalent to
  .initial:o
  .initial:x
                                 \ensuremath{\verb|keys_set:nn|} \{\langle module \rangle\} \{ \langle key \rangle = \langle value \rangle \}
 Updated: 2013-07-09
      .int_set:N
                          \langle key \rangle .int_set:N = \langle integer \rangle
       .int_set:c
                          Defines \langle key \rangle to set \langle integer \rangle to \langle value \rangle (which must be an integer expression). If the
       .int_gset:N
                          variable does not exist, it will be created globally at the point that the key is set up.
       .int_gset:c
                          \langle key \rangle .meta:n = \{\langle keyval \ list \rangle\}
  .meta:n
                          Makes \langle key \rangle a meta-key, which will set \langle keyval \ list \rangle in one go. If \langle key \rangle is given with a
 Updated: 2013-07-10
                          value at the time the key is used, then the value will be passed through to the subsidiary
                          \langle keys \rangle for processing (as #1).
      .meta:nn
                          \langle key \rangle .meta:nn = \{\langle path \rangle\} \{\langle keyval \ list \rangle\}
      New: 2013-07-10
                          Makes \langle key \rangle a meta-key, which will set \langle keyval \ list \rangle in one go using the \langle path \rangle in place of
                          the current one. If \langle key \rangle is given with a value at the time the key is used, then the value
                          will be passed through to the subsidiary \langle keys \rangle for processing (as #1).
                          \langle key \rangle .multichoice:
    .multichoice:
      New: 2011-08-21
                          Sets \langle key \rangle to act as a multiple choice key. Each valid choice for \langle key \rangle must then be
                          created, as discussed in section 3.
                          \langle key \rangle .multichoices:nn \{\langle choices \rangle\} \{\langle code \rangle\}
.multichoices:nn
.multichoices:Vn
                          Sets \langle key \rangle to act as a multiple choice key, and defines a series \langle choices \rangle which are im-
.multichoices:on
                          plemented using the \langle code \rangle. Inside \langle code \rangle, \lambda keys choice tl will be the name of the
.multichoices:xn
                          choice made, and \l_keys_choice_int will be the position of the choice in the list of
      New: 2011-08-21
                          (choices) (indexed from 1). Choices are discussed in detail in section 3.
 Updated: 2013-07-10
     .skip_set:N
                          \langle key \rangle .skip_set:N = \langle skip \rangle
     .skip_set:c
                          Defines \langle key \rangle to set \langle skip \rangle to \langle value \rangle (which must be a skip expression). If the variable
     .skip_gset:N
                          does not exist, it will be created globally at the point that the key is set up.
     .skip_gset:c
        .tl set:N
                          \langle key \rangle .tl_set:N = \langle token list variable \rangle
        .tl_set:c
                          Defines \langle key \rangle to set \langle token\ list\ variable \rangle to \langle value \rangle. If the variable does not exist, it will
        .tl_gset:N
                          be created globally at the point that the key is set up.
```

.tl\_gset:c

```
.tl_set_x:N
                         ⟨key⟩ .tl_set_x:N = ⟨token list variable⟩
       .tl_set_x:c
                         Defines \langle key \rangle to set \langle token\ list\ variable \rangle to \langle value \rangle, which will be subjected to an x-
       .tl_gset_x:N
                         type expansion (i.e. using \tl_set:Nx). If the variable does not exist, it will be created
       .tl_gset_x:c
                          globally at the point that the key is set up.

        New: 2015-07-14
                         Removes the definition of the \langle key \rangle within the current scope.
.value_forbidden:n
                         \langle key \rangle .value_forbidden:n = true|false
                         Specifies that \langle key \rangle cannot receive a \langle value \rangle when used. If a \langle value \rangle is given then an error
        New: 2015-07-14
                          will be issued. Setting the property false will cancel the restriction.
 .value_required:n
                         ⟨key⟩ .value_required:n = true|false
```

# 2 Sub-dividing keys

New: 2015-07-14

When creating large numbers of keys, it may be desirable to divide them into several sub-groups for a given module. This can be achieved either by adding a sub-division to the module name:

Specifies that  $\langle key \rangle$  must receive a  $\langle value \rangle$  when used. If a  $\langle value \rangle$  is not given then an

error will be issued. Setting the property false will cancel the restriction.

```
\keys_define:nn { module / subgroup }
    { key .code:n = code }

or to the key name:
    \keys_define:nn { mymodule }
    { subgroup / key .code:n = code }
```

As illustrated, the best choice of token for sub-dividing keys in this way is /. This is because of the method that is used to represent keys internally. Both of the above code fragments set the same key, which has full name module/subgroup/key.

As will be illustrated in the next section, this subdivision is particularly relevant to making multiple choices.

# 3 Choice and multiple choice keys

The l3keys system supports two types of choice key, in which a series of pre-defined input values are linked to varying implementations. Choice keys are usually created so that the various values are mutually-exclusive: only one can apply at any one time. "Multiple" choice keys are also supported: these allow a selection of values to be chosen at the same time.

Mutually-exclusive choices are created by setting the .choice: property:

```
\keys_define:nn { mymodule }
    { key .choice: }
```

For keys which are set up as choices, the valid choices are generated by creating sub-keys of the choice key. This can be carried out in two ways.

In many cases, choices execute similar code which is dependant only on the name of the choice or the position of the choice in the list of all possibilities. Here, the keys can share the same code, and can be rapidly created using the .choices:nn property.

The index  $\l_keys\_choice\_int$  in the list of choices starts at 1.

\l\_keys\_choice\_int
\l\_keys\_choice\_t1

Inside the code block for a choice generated using .choices:nn, the variables \l\_keys\_-choice\_tl and \l\_keys\_choice\_int are available to indicate the name of the current choice, and its position in the comma list. The position is indexed from 1. Note that, as with standard key code generated using .code:n, the value passed to the key (i.e. the choice name) is also available as #1.

On the other hand, it is sometimes useful to create choices which use entirely different code from one another. This can be achieved by setting the .choice: property of a key, then manually defining sub-keys.

```
\keys_define:nn { mymodule }
    {
       key .choice:,
       key / choice-a .code:n = code-a,
       key / choice-b .code:n = code-b,
       key / choice-c .code:n = code-c,
}
```

It is possible to mix the two methods, but manually-created choices should *not* use  $\l_keys\_choice\_tl$  or  $\l_keys\_choice\_int$ . These variables do not have defined behaviour when used outside of code created using .choices:nn (*i.e.* anything might happen).

It is possible to allow choice keys to take values which have not previously been defined by adding code for the special unknown choice. The general behavior of the unknown key is described in Section 5. A typical example in the case of a choice would be to issue a custom error message:

Multiple choices are created in a very similar manner to mutually-exclusive choices, using the properties .multichoice: and .multichoices:nn. As with mutually exclusive choices, multiple choices are define as sub-keys. Thus both

```
\keys_define:nn { mymodule }
    {
      key .multichoices:nn =
        { choice-a, choice-b, choice-c }
          You~gave~choice~'\tl_use:N \l_keys_choice_tl',~
          which~is~in~position~
          \int_use:N \l_keys_choice_int \c_space_tl
          in~the~list.
        }
    }
and
  \keys_define:nn { mymodule }
      key .multichoice:,
      key / choice-a .code:n = code-a,
      key / choice-b .code:n = code-b,
      key / choice-c .code:n = code-c,
    }
are valid.
   When a multiple choice key is set
 \keys_set:nn { mymodule }
     key = { a , b , c } % 'key' defined as a multiple choice
    }
```

each choice is applied in turn, equivalent to a clist mapping or to applying each value individually:

Thus each separate choice will have passed to it the \l\_keys\_choice\_tl and \l\_keys\_-choice\_int in exactly the same way as described for .choices:nn.

# 4 Setting keys

\keys\_set:nn \keys\_set:(nV|nv|no)

Updated: 2015-11-07

\1\_keys\_key\_t1
\1\_keys\_path\_t1
\1\_keys\_value\_t1

Updated: 2015-07-14

```
\ensuremath{\verb|keys_set:nn|} \{\langle \verb|module| \rangle\} \{\langle \verb|keyval| \ensuremath{|list|} \rangle\}
```

Parses the  $\langle keyval \ list \rangle$ , and sets those keys which are defined for  $\langle module \rangle$ . The behaviour on finding an unknown key can be set by defining a special unknown key: this will be illustrated later.

For each key processed, information of the full *path* of the key, the *name* of the key and the *value* of the key is available within three token list variables. These may be used within the code of the key.

The *value* is everything after the =, which may be empty if no value was given. This is stored in \l\_keys\_value\_tl, and is not processed in any way by \keys\_set:nn.

The *path* of the key is a "full" description of the key, and is unique for each key. It consists of the module and full key name, thus for example

```
\keys_set:nn { mymodule } { key-a = some-value }
```

has path mymodule/key-a while

```
\keys_set:nn { mymodule } { subset / key-a = some-value }
```

has path mymodule/subset/key-a. This information is stored in \l\_keys\_path\_tl, and will have been processed by \tl\_to\_str:n.

The name of the key is the part of the path after the last /, and thus is not unique. In the preceding examples, both keys have name key-a despite having different paths. This information is stored in \l\_keys\_key\_tl, and will have been processed by \tl\_-to\_str:n.

# 5 Handling of unknown keys

If a key has not previously been defined (is unknown), \keys\_set:nn will look for a special unknown key for the same module, and if this is not defined raises an error indicating that

the key name was unknown. This mechanism can be used for example to issue custom error texts.

In some cases, the desired behavior is to simply ignore unknown keys, collecting up information on these for later processing. The  $\ensuremath{\mbox{keys\_set\_known:nnN}}$  function parses the  $\langle keyval \ list \rangle$ , and sets those keys which are defined for  $\langle module \rangle$ . Any keys which are unknown are not processed further by the parser. The key-value pairs for each unknown key name will be stored in the  $\langle tl \rangle$  in a comma-separated form (i.e. an edited version of the  $\langle keyval \ list \rangle$ ). The  $\ensuremath{\mbox{keys\_set\_known:nn}}$  version skips this stage.

Use of  $\ensuremath{\texttt{keyval list}}$  returned at each stage.

# 6 Selective key setting

In some cases it may be useful to be able to select only some keys for setting, even though these keys have the same path. For example, with a set of keys defined using

the use of \keys\_set:nn will attempt to set all four keys. However, in some contexts it may only be sensible to set some keys, or to control the order of setting. To do this, keys may be assigned to *groups*: arbitrary sets which are independent of the key tree. Thus modifying the example to read

```
\keys define:nn { mymodule }
   {
    key-one    .code:n = { \my_func:n {#1} } ,
    key-one    .groups:n = { first }
    ,
```

will assign key-one and key-two to group first, key-three to group second, while key-four is not assigned to a group.

Selective key setting may be achieved either by selecting one or more groups to be made "active", or by marking one or more groups to be ignored in key setting.

```
\keys_set_filter:nnnN \keys_set_filter:nnnN {\module\} {\langle groups\} {\langle keyval list\} \langle t1\\keys_set_filter:nnn \keys_set_filter:nnn \keys_set_filter:(nnV|nnv|nno)

New: 2013-07-14
Updated: 2015-11-07
```

Actives key filtering in an "opt-out" sense: keys assigned to any of the  $\langle groups \rangle$  specified will be ignored. The  $\langle groups \rangle$  are given as a comma-separated list. Unknown keys are not assigned to any group and will thus always be set. The key-value pairs for each key which is filtered out will be stored in the  $\langle tl \rangle$  in a comma-separated form (i.e. an edited version of the  $\langle keyval \ list \rangle$ ). The \keys\_set\_filter:nnn version skips this stage.

Use of  $\ensuremath{\texttt{keyval list}}$  returned at each stage.

Actives key filtering in an "opt-in" sense: only keys assigned to one or more of the  $\langle groups \rangle$  specified will be set. The  $\langle groups \rangle$  are given as a comma-separated list. Unknown keys are not assigned to any group and will thus never be set.

# 7 Utility functions for keys

Tests if the  $\langle choice \rangle$  is defined for the  $\langle key \rangle$  within the  $\langle module \rangle$ , i.e. if any code has been defined for  $\langle key \rangle / \langle choice \rangle$ . The test is false if the  $\langle key \rangle$  itself is not defined.

\keys\_show:nn

```
\keys\_show:nn {\langle module \rangle} {\langle key \rangle}
```

Updated: 2015-08-09

Shows the information associated to the  $\langle key \rangle$  for a  $\langle module \rangle$ , including the function which is used to actually implement it.

## 8 Low-level interface for parsing key-val lists

To re-cap from earlier, a key-value list is input of the form

```
KeyOne = ValueOne ,
KeyTwo = ValueTwo ,
KeyThree
```

where each key-value pair is separated by a comma from the rest of the list, and each key-value pair does not necessarily contain an equals sign or a value! Processing this type of input correctly requires a number of careful steps, to correctly account for braces, spaces and the category codes of separators.

While the functions described earlier are used as a high-level interface for processing such input, in special circumstances you may wish to use a lower-level approach. The low-level parsing system converts a  $\langle key-value\ list\rangle$  into  $\langle keys\rangle$  and associated  $\langle values\rangle$ . After the parsing phase is completed, the resulting keys and values (or keys alone) are available for further processing. This processing is not carried out by the low-level parser itself, and so the parser requires the names of two functions along with the key-value list. One function is needed to process key-value pairs (it receives two arguments), and a second function is required for keys given without any value (it is called with a single argument).

The parser does not double # tokens or expand any input. Active tokens = and , appearing at the outer level of braces are converted to category "other" (12) so that the parser does not "miss" any due to category code changes. Spaces are removed from the ends of the keys and values. Keys and values which are given in braces will have exactly one set removed (after space trimming), thus

```
key = {value here},
and
key = value here,
```

are treated identically.

\keyval\_parse:NNn

Updated: 2011-09-08

```
\ensuremath{\texttt{NNn}}\ \langle function_1 \rangle\ \langle function_2 \rangle\ \{\langle key-value\ list \rangle\}
```

Parses the  $\langle key-value\ list \rangle$  into a series of  $\langle keys \rangle$  and associated  $\langle values \rangle$ , or keys alone (if no  $\langle value \rangle$  was given).  $\langle function_1 \rangle$  should take one argument, while  $\langle function_2 \rangle$  should absorb two arguments. After \keyval\_parse:NNn has parsed the  $\langle key-value\ list \rangle$ ,  $\langle function_1 \rangle$  will be used to process keys given with no value and  $\langle function_2 \rangle$  will be used to process keys given with a value. The order of the  $\langle keys \rangle$  in the  $\langle key-value\ list \rangle$  will be preserved. Thus

```
\keyval_parse:NNn \function:n \function:nn
    { key1 = value1 , key2 = value2, key3 = , key4 }
will be converted into an input stream
    \function:nn { key1 } { value1 }
    \function:nn { key2 } { value2 }
```

\function:nn { key2 } { value2 } \function:nn { key3 } { } \function:n { key4 }

Note that there is a difference between an empty value (an equals sign followed by nothing) and a missing value (no equals sign at all). Spaces are trimmed from the ends of the  $\langle key \rangle$  and  $\langle value \rangle$ , then one *outer* set of braces is removed from the  $\langle key \rangle$  and  $\langle value \rangle$  as part of the processing.

#### Part XXI

# The l3file package File and I/O operations

This module provides functions for working with external files. Some of these functions apply to an entire file, and have prefix \file\_..., while others are used to work with files on a line by line basis and have prefix \ior\_... (reading) or \iow\_... (writing).

It is important to remember that when reading external files TEX will attempt to locate them both the operating system path and entries in the TEX file database (most TEX systems use such a database). Thus the "current path" for TEX is somewhat broader than that for other programs.

For functions which expect a  $\langle file\ name \rangle$  argument, this argument may contain both literal items and expandable content, which should on full expansion be the desired file name. Any active characters (as declared in  $\lower_{active\_seq}$ ) will not be expanded, allowing the direct use of these in file names. File names will be quoted using " tokens if they contain spaces: as a result, " tokens are not permitted in file names.

## 1 File operation functions

\g\_file\_current\_name\_tl

Contains the name of the current IATEX file. This variable should not be modified: it is intended for information only. It will be equal to \c\_sys\_jobname\_str at the start of a IATEX run and will be modified each time a file is read using \file\_input:n.

\file\_if\_exist:nTF

Updated: 2012-02-10

Searches for \( \file name \) using the current TeX search path and the additional paths controlled by \file\_path\_include:n).

\file\_add\_path:nN

\file\_add\_path:nN {\langle file name \rangle} \langle tl var \rangle

Updated: 2012-02-10

Searches for  $\langle file\ name \rangle$  in the path as detailed for \file\_if\_exist:nTF, and if found sets the  $\langle tl\ var \rangle$  the fully-qualified name of the file, *i.e.* the path and file name. If the file is not found then the  $\langle tl\ var \rangle$  will contain the marker \q\_no\_value.

\file\_input:n

\file\_input:n  $\{\langle file\ name \rangle\}$ 

Updated: 2012-02-17

Searches for \( \file name \) in the path as detailed for \file\_if\_exist:nTF, and if found reads in the file as additional LATEX source. All files read are recorded for information and the file name stack is updated by this function. An error will be raised if the file is not found.

\file\_path\_include:n

 $file_path_include:n \{\langle path \rangle\}$ 

Updated: 2012-07-04

Adds  $\langle path \rangle$  to the list of those used to search when reading files. The assignment is local. The  $\langle path \rangle$  is processed in the same way as a  $\langle file\ name \rangle$ , i.e., with x-type expansion except active characters.

\file\_path\_remove:n

\file\_path\_remove:n {\langle path \rangle}

Updated: 2012-07-04

Removes  $\langle path \rangle$  from the list of those used to search when reading files. The assignment is local. The  $\langle path \rangle$  is processed in the same way as a  $\langle file\ name \rangle$ , i.e., with x-type expansion except active characters.

\file\_list:

\file\_list:

This function will list all files loaded using \file\_input:n in the log file.

#### Input-output stream management

As T<sub>F</sub>X is limited to 16 input streams and 16 output streams, direct use of the streams by the programmer is not supported in LATEX3. Instead, an internal pool of streams is maintained, and these are allocated and deallocated as needed by other modules. As a result, the programmer should close streams when they are no longer needed, to release them for other processes.

Note that I/O operations are global: streams should all be declared with global names and treated accordingly.

\ior\_new:N

\ior\_new:N \( stream \) \iow\_new:N \( stream \)

\ior\_new:c \iow\_new:N

\iow\_new:c

New: 2011-09-26 Updated: 2011-12-27 Globally reserves the name of the  $\langle stream \rangle$ , either for reading or for writing as appropriate. The \(\stream\) is not opened until the appropriate \\\..\_open:\(\mathbb{N}n\) function is used. Attempting to use a  $\langle stream \rangle$  which has not been opened is an error, and the  $\langle stream \rangle$ will behave as the corresponding \c\_term\_....

\ior\_open:Nn \ior\_open:cn

\ior\_open:Nn \( stream \) \( \{ file name \) \}

Updated: 2012-02-10

Opens  $\langle file\ name \rangle$  for reading using  $\langle stream \rangle$  as the control sequence for file access. If the  $\langle stream \rangle$  was already open it is closed before the new operation begins. The  $\langle stream \rangle$  is available for access immediately and will remain allocated to \( file name \) until a \ior\_close: N instruction is given or the TFX run ends.

\ior\_open:NnTF \ior\_open:cnTF  $\colon{cond} \colon open: NnTF & stream & {\langle file name \rangle} & {\langle true code \rangle} & {\langle false code \rangle} \\$ 

New: 2013-01-12

Opens  $\langle file\ name \rangle$  for reading using  $\langle stream \rangle$  as the control sequence for file access. If the  $\langle stream \rangle$  was already open it is closed before the new operation begins. The  $\langle stream \rangle$  is available for access immediately and will remain allocated to \( file name \) until a \ior\_close: N instruction is given or the  $T_{FX}$  run ends. The  $\langle true\ code \rangle$  is then inserted into the input stream. If the file is not found, no error is raised and the  $\langle false\ code \rangle$  is inserted into the input stream.

\iow\_open:Nn
\iow\_open:cn

 $\iow_open: Nn \slash stream \slash \{ file name \slash \}$ 

Updated: 2012-02-09

Opens  $\langle file\ name \rangle$  for writing using  $\langle stream \rangle$  as the control sequence for file access. If the  $\langle stream \rangle$  was already open it is closed before the new operation begins. The  $\langle stream \rangle$  is available for access immediately and will remain allocated to  $\langle file\ name \rangle$  until a \iow\_-close:N instruction is given or the TEX run ends. Opening a file for writing will clear any existing content in the file (*i.e.* writing is *not* additive).

\ior\_close:N
\ior\_close:c
\iov\_close:N

 $\ion_{close:N} \langle stream \rangle$  $\iow_{close:N} \langle stream \rangle$ 

\iow\_close:N
\iow\_close:c

Closes the  $\langle stream \rangle$ . Streams should always be closed when they are finished with as this ensures that they remain available to other programmers.

Updated: 2012-07-31

\ior\_list\_streams: \ior\_list\_streams:

\iow\_list\_streams:

\iow\_list\_streams:

Updated: 2015-08-01

Displays a list of the file names associated with each open stream: intended for tracking down problems.

#### 1.2 Reading from files

\ior\_get:NN

\ior\_get:NN \( stream \) \( \tau \) list variable \( \)

New: 2012-06-24

Function that reads one or more lines (until an equal number of left and right braces are found) from the input  $\langle stream \rangle$  and stores the result locally in the  $\langle token\ list \rangle$  variable. If the  $\langle stream \rangle$  is not open, input is requested from the terminal. The material read from the  $\langle stream \rangle$  will be tokenized by TEX according to the category codes in force when the function is used. Note that any blank lines will be converted to the token \par. Therefore, if skipping blank lines is requires a test such as

```
\ior_get:NN \l_my_stream \l_tmpa_tl
\tl_set:Nn \l_tmpb_tl { \par }
\tl_if_eq:NNF \l_tmpa_tl \l_tmpb_tl
```

may be used. Also notice that if multiple lines are read to match braces then the resulting token list will contain  $\protect$ 

ab c

will result in a token list a b c .

 $\mathbf{T}_{\mathbf{E}}\mathbf{X}$  hackers note: This protected macro expands to the  $\mathbf{T}_{\mathbf{E}}\mathbf{X}$  primitive \read along with the to keyword.

\ior\_get\_str:NN

\ior\_get\_str:NN \( \stream \) \( \taken list variable \)

New: 2012-06-24 Updated: 2012-07-31 Function that reads one line from the input  $\langle stream \rangle$  and stores the result locally in the  $\langle token\ list \rangle$  variable. If the  $\langle stream \rangle$  is not open, input is requested from the terminal. The material is read from the  $\langle stream \rangle$  as a series of tokens with category code 12 (other), with the exception of space characters which are given category code 10 (space). Multiple whitespace characters are retained by this process. It will always only read one line and any blank lines in the input will result in the  $\langle token\ list\ variable \rangle$  being empty. Unlike \ior\_get:NN, line ends do not receive any special treatment. Thus input

ab c

will result in a token list a b c with the letters a, b, and c having category code 12.

**TEXhackers note:** This protected macro is a wrapper around the  $\varepsilon$ -TEX primitive \readline. However, the end-line character normally added by this primitive is not included in the result of \ior\_get\_str:NN.

\ior\_if\_eof\_p:N \*
\ior\_if\_eof:NTF \*

 $\begin{tabular}{ll} $$ \ior_if_eof_p:N \ \langle stream \rangle $$ \ior_if_eof:NTF \ \langle stream \rangle \ \{\langle true \ code \rangle\} \ \{\langle false \ code \rangle\} \end{tabular} $$ \label{table_p:node_p} $$ \end{tabular} $$ \end{t$ 

Updated: 2012-02-10

Tests if the end of a  $\langle stream \rangle$  has been reached during a reading operation. The test will also return a **true** value if the  $\langle stream \rangle$  is not open.

# 2 Writing to files

\iow\_now:Nn

\iow\_now:(Nx|cn|cx)

Updated: 2012-06-05

 $\inv _{now:Nn \ \langle stream \rangle \ \{\langle tokens \rangle\}}$ 

This functions writes  $\langle tokens \rangle$  to the specified  $\langle stream \rangle$  immediately (*i.e.* the write operation is called on expansion of \iow\_now:Nn).

\iow\_log:n \iow\_log:x  $\iow_log:n {\langle tokens \rangle}$ 

This function writes the given  $\langle tokens \rangle$  to the log (transcript) file immediately: it is a dedicated version of  $\iow_now:Nn$ .

\iow\_term:n
\iow\_term:x

 $\iow_term:n \{\langle tokens \rangle\}$ 

This function writes the given  $\langle tokens \rangle$  to the terminal file immediately: it is a dedicated version of  $\iom_now:Nn$ .

\iow\_shipout:Nn
\iow\_shipout:(Nx|cn|cx)

 $\iow_shipout:Nn \langle stream \rangle \{\langle tokens \rangle\}$ 

This functions writes  $\langle tokens \rangle$  to the specified  $\langle stream \rangle$  when the current page is finalised (*i.e.* at shipout). The x-type variants expand the  $\langle tokens \rangle$  at the point where the function is used but *not* when the resulting tokens are written to the  $\langle stream \rangle$  (*cf.*\iow\_shipout\_-x:Nn).

**TEXhackers note:** When using expl3 with a format other than LATEX, new line characters inserted using \iow\_newline: or using the line-wrapping code \iow\_wrap:nnnN will not be recognized in the argument of \iow\_shipout:Nn. This may lead to the insertion of additionnal unwanted line-breaks.

\iow\_shipout\_x:Nn
\iow\_shipout\_x:(Nx|cn|cx)

 $\verb|\iow_shipout_x:Nn| \langle stream \rangle | \{\langle tokens \rangle\}|$ 

This functions writes  $\langle tokens \rangle$  to the specified  $\langle stream \rangle$  when the current page is finalised (*i.e.* at shipout). The  $\langle tokens \rangle$  are expanded at the time of writing in addition to any expansion when the function is used. This makes these functions suitable for including material finalised during the page building process (such as the page number integer).

**TEX** hackers note: This is a wrapper around the TEX primitive \write. When using expl3 with a format other than LATEX, new line characters inserted using \iow\_newline: or using the line-wrapping code \iow\_wrap:nnnN will not be recognized in the argument of \iow\_shipout:Nn. This may lead to the insertion of additionnal unwanted line-breaks.

\iow\_char:N ★

Updated: 2012-09-08

Inserts  $\langle char \rangle$  into the output stream. Useful when trying to write difficult characters such as %,  $\{$ ,  $\}$ , etc. in messages, for example:

\iow\_now:Nx \g\_my\_iow { \iow\_char:N \{ text \iow\_char:N \} }

The function has no effect if writing is taking place without expansion (e.g. in the second argument of \iow\_now:Nn).

\iow\_newline: ★

\iow\_newline:

Function to add a new line within the  $\langle tokens \rangle$  written to a file. The function has no effect if writing is taking place without expansion (e.g. in the second argument of \iow\_now:Nn).

**TEXhackers note:** When using expl3 with a format other than LaTeX, the character inserted by  $\boxtimes$  will not be recognized by TeX, which may lead to the insertion of additionnal unwanted line-breaks. This issue only affects  $\boxtimes$  note and direct uses of primitive operations.

#### 2.1 Wrapping lines in output

\iow\_wrap:nnnN

 $\label{low_wrap:nnnN} $$ \{\langle text \rangle\} $$ {\langle run-on\ text \rangle} $$ {\langle set\ up \rangle} $$ \langle function \rangle$$ 

New: 2012-06-28 Updated: 2015-08-05 This function will wrap the  $\langle text \rangle$  to a fixed number of characters per line. At the start of each line which is wrapped, the  $\langle run\text{-}on\ text \rangle$  will be inserted. The line character count targeted will be the value of \lorenteq \lorenteq \cup \lorenteq \text{count\_int} \text{ minus the number of characters in the } \larenteq run\cup \text{ for all lines except the first, for which the target number of characters is simply \lorenteq \lorenteq \text{iow\_line\_count\_int} \text{ since there is no run-on text. The } \larenteq \text{text} \rangle \text{ and } \larenteq run\cup \text{on} \text{text} \rangle \text{ are exhaustively expanded by the function, with the following substitutions:}

- \\ may be used to force a new line,
- \u may be used to represent a forced space (for example after a control sequence),
- \#, \%, \{, \}, \~ may be used to represent the corresponding character,
- \iow\_indent:n may be used to indent a part of the  $\langle text \rangle$  (not the  $\langle run\text{-}on \ text \rangle$ ).

Additional functions may be added to the wrapping by using the  $\langle set\ up \rangle$ , which is executed before the wrapping takes place: this may include overriding the substitutions listed.

Any expandable material in the  $\langle text \rangle$  which is not to be expanded on wrapping should be converted to a string using \token\_to\_str:N, \tl\_to\_str:n, \tl\_to\_str:N, etc.

The result of the wrapping operation is passed as a braced argument to the  $\langle function \rangle$ , which will typically be a wrapper around a write operation. The output of \iow\_wrap:nnnN (i.e. the argument passed to the  $\langle function \rangle$ ) will consist of characters of category "other" (category code 12), with the exception of spaces which will have category "space" (category code 10). This means that the output will not expand further when written to a file.

**TEXhackers note:** Internally, \iow\_wrap:nnnN carries out an x-type expansion on the  $\langle text \rangle$  to expand it. This is done in such a way that \exp\_not:N or \exp\_not:n could be used to prevent expansion of material. However, this is less conceptually clear than conversion to a string, which is therefore the supported method for handling expandable material in the  $\langle text \rangle$ .

\iow\_indent:n

\iow\_indent:n  $\{\langle text \rangle\}$ 

New: 2011-09-21

In the first argument of  $\iow_wrap:nnnN$  (for instance in messages), indents  $\langle text \rangle$  by four spaces. This function will not cause a line break, and only affects lines which start within the scope of the  $\langle text \rangle$ . In case the indented  $\langle text \rangle$  should appear on separate lines from the surrounding text, use  $\i$  to force line breaks.

 $\label{line_count_int} $$ l_iow_line_count_int $$$ 

New: 2012-06-24

The maximum number of characters in a line to be written by the \iow\_wrap:nnnN function. This value depends on the TEX system in use: the standard value is 78, which is typically correct for unmodified TEX ive and MiKTEX systems.

\c\_catcode\_other\_space\_tl

New: 2011-09-05

Token list containing one character with category code 12, ("other"), and character code 32 (space).

#### 2.2 Constant input-output streams

\c\_term\_ior

Constant input stream for reading from the terminal. Reading from this stream using  $\ightharpoonup get:NN or similar will result in a prompt from TEX of the form$ 

<t1>=

\c\_log\_iow
\c\_term\_iow

Constant output streams for writing to the log and to the terminal (plus the log), respectively.

#### 2.3 Primitive conditionals

\if\_eof:w \*

```
\if_eof:w \( stream \)
  \( \tau code \)
\else:
  \( \false code \)
\fi:
```

Tests if the  $\langle stream \rangle$  returns "end of file", which is true for non-existent files. The **\else**: branch is optional.

TeXhackers note: This is the TeX primitive \ifeof.

#### 2.4 Internal file functions and variables

\g\_\_file\_internal\_ior

Used to test for the existence of files when opening.

\l\_\_file\_internal\_name\_tl

Used to return the full name of a file for internal use. This is set by \file\_if\_-exist:n(TF) and \\_\_file\_if\_exist:nT, and the value may then be used to load a file directly provided no further operations intervene.

\\_\_file\_name\_sanitize:nn

```
\_file_name_sanitize:nn {\langle name \rangle} {\langle tokens \rangle}
```

New: 2012-02-09

Exhaustively-expands the  $\langle name \rangle$  with the exception of any category  $\langle active \rangle$  (catcode 13) tokens, which are not expanded. The list of  $\langle active \rangle$  tokens is taken from \l\_char\_-active\_seq. The  $\langle sanitized\ name \rangle$  is then inserted (in braces) after the  $\langle tokens \rangle$ , which should further process the file name. If any spaces are found in the name after expansion, an error is raised.

### 2.5 Internal input-output functions

\\_\_ior\_open:Nn \\_\_ior\_open:No  $\verb|\__ior_open:Nn $\langle stream \rangle $ \{ \langle file name \rangle \}$ 

New: 2012-01-23

This function has identical syntax to the public version. However, is does not take precautions against active characters in the  $\langle file\ name \rangle$ , and it does not attempt to add a  $\langle path \rangle$  to the  $\langle file\ name \rangle$ : it is therefore intended to be used by higher-level functions which have already fully expanded the  $\langle file\ name \rangle$  and which need to perform multiple open or close operations. See for example the implementation of \file\_add\_path:nN,

\\_\_iow\_with:Nnn

 $\label{locality} $$\sum_{i=1}^{\infty} {\operatorname{integer}} {\langle \operatorname{value} \rangle} {\langle \operatorname{code} \rangle}$$ 

New: 2014-08-23

If the  $\langle integer \rangle$  is equal to the  $\langle value \rangle$  then this function simply runs the  $\langle code \rangle$ . Otherwise it saves the current value of the  $\langle integer \rangle$ , sets it to the  $\langle value \rangle$ , runs the  $\langle code \rangle$ , and restores the  $\langle integer \rangle$  to its former value. This is used to ensure that the \newlinechar is 10 when writing to a stream, which lets \iow\_newline: work, and that \errorcontextlines is -1 when displaying a message.

### Part XXII

# The **I3fp** package: floating points

A decimal floating point number is one which is stored as a significand and a separate exponent. The module implements expandably a wide set of arithmetic, trigonometric, and other operations on decimal floating point numbers, to be used within floating point expressions. Floating point expressions support the following operations with their usual precedence.

- Basic arithmetic: addition x + y, subtraction x y, multiplication x \* y, division x/y, square root  $\sqrt{x}$ , and parentheses.
- Comparison operators: x < y, x <= y, x > ?y, x! = y etc.
- Boolean logic: negation ! x, conjunction x && y, disjunction x || y, ternary operator x ? y : z.
- Exponentials:  $\exp x$ ,  $\ln x$ ,  $x^y$ .
- Trigonometry:  $\sin x$ ,  $\cos x$ ,  $\tan x$ ,  $\cot x$ ,  $\sec x$ ,  $\csc x$  expecting their arguments in radians, and  $\sin dx$ ,  $\cos dx$ ,  $\tan dx$ ,  $\cot dx$ ,  $\sec dx$ ,  $\csc dx$  expecting their arguments in degrees.
- Inverse trigonometric functions:  $a\sin x$ ,  $a\cos x$ ,  $a\tan x$ ,  $a\cot x$ ,  $a\sec x$ ,  $a\csc x$  giving a result in radians, and  $a\sin dx$ ,  $a\cos dx$ ,  $a\tan dx$ ,  $a\cot dx$ ,  $a\sec dx$ ,  $a\sec dx$  giving a result in degrees.

(not yet) Hyperbolic functions and their inverse functions:  $\sinh x$ ,  $\cosh x$ ,  $\tanh x$ ,  $\coth x$ ,  $\operatorname{sech} x$ ,  $\operatorname{csch} x$ , and  $\operatorname{asinh} x$ ,  $\operatorname{acosh} x$ , atanh x, acoth x, asch x, asch x.

- Extrema:  $\max(x, y, ...)$ ,  $\min(x, y, ...)$ , abs(x).
- Rounding functions (n=0) by default, t= NaN by default):  $\operatorname{trunc}(x,n)$  rounds towards zero,  $\operatorname{floor}(x,n)$  rounds towards  $-\infty$ ,  $\operatorname{ceil}(x,n)$  rounds towards  $+\infty$ ,  $\operatorname{round}(x,n,t)$  rounds to the closest value, with ties rounded to an even value by default, towards zero if t=0, towards  $+\infty$  if t>0 and towards  $-\infty$  if t<0. And  $(not\ yet)$  modulo, and "quantize".
- Constants: pi, deg (one degree in radians).
- Dimensions, automatically expressed in points, e.g., pc is 12.
- Automatic conversion (no need for \\tauture \\_use:N) of integer, dimension, and skip variables to floating points, expressing dimensions in points and ignoring the stretch and shrink components of skips.

Floating point numbers can be given either explicitly (in a form such as 1.234e-34, or -.0001), or as a stored floating point variable, which is automatically replaced by its current value. See section 9.1 for a description of what a floating point is, section 9.2

for details about how an expression is parsed, and section 9.3 to know what the various operations do. Some operations may raise exceptions (error messages), described in section 7.

An example of use could be the following.

```
\label{lambda} $$ \operatorname{Compute: } \frac{(3.5)}{2} + 2\cdot 10^{-3} = \operatorname{ExplSyntaxOn \ fp_to_decimal:n \ 3.5 /2 + 2e-3} $.
```

But in all fairness, this module is mostly meant as an underlying tool for higher-level commands. For example, one could provide a function to typeset nicely the result of floating point computations.

```
\usepackage{xparse, siunitx}
\ExplSyntaxOn
\NewDocumentCommand { \calcnum } { m }
      { \num { \fp_to_scientific:n {#1} } }
\ExplSyntaxOff
\calcnum { 2 pi * sin ( 2.3 ^ 5 ) }
```

# 1 Creating and initialising floating point variables

```
\fp_new:N
                       \fp_new:N \langle fp var \rangle
\fp_new:c

#### Setting floating point variables $\mathbf{2}$

\fp\_set:Nn \fp\_set:cn \fp\_gset:Nn \fp\_gset:cn \fp\_set:Nn \langle fp var \rangle \langle floating point expression \rangle \rangle

Sets  $\langle fp \ var \rangle$  equal to the result of computing the  $\langle floating \ point \ expression \rangle$ .

Updated: 2012-05-08

\fp\_set\_eq:NN

\fp\_set\_eq:(cN|Nc|cc) \fp\_gset\_eq:NN

\fp\_gset\_eq:(cN|Nc|cc)

Updated: 2012-05-08

 $fp_set_eq:NN \langle fp \ var_1 \rangle \langle fp \ var_2 \rangle$ 

Sets the floating point variable  $\langle fp \ var_1 \rangle$  equal to the current value of  $\langle fp \ var_2 \rangle$ .

\fp\_add:Nn \fp\_add:cn \fp\_gadd:Nn

\fp\_gadd:cn

Updated: 2012-05-08

 $fp_add:Nn \langle fp \ var \rangle \{\langle floating \ point \ expression \rangle\}$ 

Adds the result of computing the  $\langle floating\ point\ expression \rangle$  to the  $\langle fp\ var \rangle$ .

\fp sub:Nn

\fp\_sub:cn

\fp\_gsub:Nn \fp\_gsub:cn

Updated: 2012-05-08

\fp\_sub:Nn \langle fp var \rangle \langle floating point expression \rangle \rangle

Subtracts the result of computing the  $\langle floating\ point\ expression \rangle$  from the  $\langle fp\ var \rangle$ .

#### Using floating point numbers 3

\fp\_eval:n

\fp\_eval:n {\langle floating point expression \rangle}

New: 2012-05-08 Updated: 2012-07-08 Evaluates the (floating point expression) and expresses the result as a decimal number with no exponent. Leading or trailing zeros may be inserted to compensate for the exponent. Non-significant trailing zeros are trimmed, and integers are expressed without a decimal separator. The values  $\pm \infty$  and NaN trigger an "invalid operation" exception. This function is identical to \fp\_to\_decimal:n.

\fp\_to\_decimal:N \* \fp\_to\_decimal:c

\fp\_to\_decimal:N \langle fp var \rangle

 $\footnotemants for the property of the prope$ 

\fp\_to\_decimal:n \*

New: 2012-05-08 Updated: 2012-07-08 Evaluates the  $\langle floating\ point\ expression \rangle$  and expresses the result as a decimal number with no exponent. Leading or trailing zeros may be inserted to compensate for the exponent. Non-significant trailing zeros are trimmed, and integers are expressed without a decimal separator. The values  $\pm \infty$  and NaN trigger an "invalid operation" exception.

```
\fp_to_dim:N * \fp_to_dim:N \langle fp var \\
\fp_to_dim:c * \fp_to_dim:n \langle floating point expression \rangle \\
\fp_to_dim:n * Evaluates the \langle floating point expression \rangle and
```

Evaluates the  $\langle floating\ point\ expression \rangle$  and expresses the result as a dimension (in pt) suitable for use in dimension expressions. The output is identical to \fp\_to\_decimal:n, with an additional trailing pt (both letter tokens). In particular, the result may be outside the range  $[-2^{14}+2^{-17},2^{14}-2^{-17}]$  of valid TeX dimensions, leading to overflow errors if used as a dimension. The values  $\pm \infty$  and NaN trigger an "invalid operation" exception.

```
\fp_to_int:N * \fp_to_int:N \langle fp var \\
\fp_to_int:c * \fp_to_int:n \langle floating point expression \rangle \\
\fp_to_int:n * Evaluates the \langle floating point expression \rangle and \\
\frac{1}{2} \
```

Updated: 2012-07-08

New: 2012-05-08

Updated: 2016-03-22

Updated: 2016-03-22

Evaluates the  $\langle floating\ point\ expression \rangle$ , and rounds the result to the closest integer, rounding exact ties to an even integer. The result may be outside the range  $[-2^{31}+1,2^{31}-1]$  of valid TEX integers, leading to overflow errors if used in an integer expression. The values  $\pm\infty$  and NaN trigger an "invalid operation" exception.

```
\fp_to_scientific:N \times \fp_to_scientific:N \langle fp var \fp_to_scientific:c \times \fp_to_scientific:n \langle floating point expression \rangle \frac{f}{f} \frac{f}{f}
```

 $\underline{\text{ fp_to\_scientific:n }}$  Evaluates the  $\langle floating\ point\ expression \rangle$  and expresses the result in scientific notation:

```
\langle optional - \rangle \langle digit \rangle . \langle 15 \ digits \rangle e \langle optional \ sign \rangle \langle exponent \rangle
```

The leading  $\langle digit \rangle$  is non-zero except in the case of  $\pm 0$ . The values  $\pm \infty$  and NaN trigger an "invalid operation" exception. Normal category codes apply: thus the e is category code 11 (a letter).

Updated: 2016-03-22

Evaluates the  $\langle floating\ point\ expression \rangle$  and expresses the result in (almost) the shortest possible form. Numbers in the ranges  $(0,10^{-3})$  and  $[10^{16},\infty)$  are expressed in scientific notation with trailing zeros trimmed and no decimal separator when there is a single significant digit (see \fp\_to\_scientific:n). Numbers in the range  $[10^{-3},10^{16})$  are expressed in a decimal notation without exponent, with trailing zeros trimmed, and no decimal separator for integer values (see \fp\_to\_decimal:n. Negative numbers start with -. The special values  $\pm 0, \pm \infty$  and NaN are rendered as 0, -0, inf, -inf, and nan respectively. Normal category codes apply and thus inf or nan, if produced, will be made up of letters.

Updated: 2012-07-08

Inserts the value of the  $\langle fp\ var \rangle$  into the input stream as a decimal number with no exponent. Leading or trailing zeros may be inserted to compensate for the exponent. Non-significant trailing zeros are trimmed. Integers are expressed without a decimal separator. The values  $\pm \infty$  and NaN trigger an "invalid operation" exception. This function is identical to  $fp_{to_decimal:N}$ .

# 4 Floating point conditionals

Compares the  $\langle fpexpr_1 \rangle$  and the  $\langle fpexpr_2 \rangle$ , and returns true if the  $\langle relation \rangle$  is obeyed. Two floating point numbers x and y may obey four mutually exclusive relations:  $x\langle y,x=y,x\rangle y$ , or x and y are not ordered. The latter case occurs exactly when either operand is NaN, and this relation is denoted by the symbol ?. Note that a NaN is distinct from any value, even another NaN, hence x=x is not true for a NaN. To test if a value is NaN, compare it to an arbitrary number with the "not ordered" relation.

```
\fp_compare:nNnTF { <value> } ? { 0 }
   { } % <value> is nan
   { } % <value> is not nan
```

 $\langle fpexpr_1 \rangle \ \langle relation_1 \rangle \\ \dots \\ \langle fpexpr_N \rangle \ \langle relation_N \rangle \\ \langle fpexpr_{N+1} \rangle \\ \} \\ \langle fpexpr_1 \rangle \ \langle relation_1 \rangle \\ \dots \\ \langle fpexpr_N \rangle \ \langle relation_N \rangle \\ \langle fpexpr_{N+1} \rangle \\ \} \\ \{\langle true \ code \rangle \} \ \{\langle false \ code \rangle \} \\ Evaluates the \ \langle floating \ point \ expression of the consequent result using the consequent is result.$ 

Evaluates the (floating point expressions) as described for \fp\_eval:n and compares consecutive result using the corresponding  $\langle relation \rangle$ , namely it compares  $\langle intexpr_1 \rangle$  and  $\langle intexpr_2 \rangle$  using the  $\langle relation_1 \rangle$ , then  $\langle intexpr_2 \rangle$  and  $\langle intexpr_3 \rangle$  using the  $\langle relation_2 \rangle$ , until finally comparing  $\langle intexpr_N \rangle$  and  $\langle intexpr_{N+1} \rangle$  using the  $\langle relation_N \rangle$ . The test yields true if all comparisons are true. Each (floating point expression) is evaluated only once. Contrarily to \int\_compare:nTF, all \( \) floating point expressions\( \) are computed, even if one comparison is false. Two floating point numbers x and y may obey four mutually exclusive relations:  $x\langle y, x=y, x\rangle y$ , or x and y are not ordered. The latter case occurs exactly when one of the operands is NaN, and this relation is denoted by the symbol ?. Each  $\langle relation \rangle$  can be any (non-empty) combination of  $\langle , =, \rangle$ , and ?, plus an optional leading! (which negates the  $\langle relation \rangle$ ), with the restriction that the  $\langle relation \rangle$  may not start with?, as this symbol has a different meaning (in combination with:) within floatin point expressions. The comparison  $x \langle relation \rangle y$  is then true if the  $\langle relation \rangle$ does not start with ! and the actual relation (<, =, >, or ?) between x and y appears within the  $\langle relation \rangle$ , or on the contrary if the  $\langle relation \rangle$  starts with! and the relation between x and y does not appear within the  $\langle relation \rangle$ . Common choices of  $\langle relation \rangle$ include >= (greater or equal), != (not equal), !? or <=> (comparable).

# 5 Floating point expression loops

```
\fp_do_until:nNnn 🌣
```

```
fp_do_until:nNnn {\langle fpexpr_1 \rangle} \langle relation \rangle {\langle fpexpr_2 \rangle} {\langle code \rangle}
```

New: 2012-08-16

Places the  $\langle code \rangle$  in the input stream for TEX to process, and then evaluates the relationship between the two  $\langle floating\ point\ expressions \rangle$  as described for \fp\_compare:nNnTF. If the test is false then the  $\langle code \rangle$  will be inserted into the input stream again and a loop will occur until the  $\langle relation \rangle$  is true.

\fp\_do\_while:nNnn 🌣

 $fp_do_while:nNnn {\langle fpexpr_1 \rangle} \langle relation \rangle {\langle fpexpr_2 \rangle} {\langle code \rangle}$ 

New: 2012-08-16

Places the  $\langle code \rangle$  in the input stream for TEX to process, and then evaluates the relationship between the two  $\langle floating\ point\ expressions \rangle$  as described for \fp\_compare:nNnTF. If the test is true then the  $\langle code \rangle$  will be inserted into the input stream again and a loop will occur until the  $\langle relation \rangle$  is false.

\fp\_until\_do:nNnn ☆

 $fp\_until\_do:nNnn {\langle fpexpr_1 \rangle} \langle relation \rangle {\langle fpexpr_2 \rangle} {\langle code \rangle}$ 

New: 2012-08-16

Evaluates the relationship between the two  $\langle floating\ point\ expressions \rangle$  as described for  $fp\_compare:nNnTF$ , and then places the  $\langle code \rangle$  in the input stream if the  $\langle relation \rangle$  is false. After the  $\langle code \rangle$  has been processed by  $T_EX$  the test will be repeated, and a loop will occur until the test is true.

\fp\_while\_do:nNnn ☆

 $fp\_while\_do:nNnn {\langle fpexpr_1 \rangle} \langle relation \rangle {\langle fpexpr_2 \rangle} {\langle code \rangle}$ 

New: 2012-08-16

Evaluates the relationship between the two  $\langle floating\ point\ expressions \rangle$  as described for  $fp\_compare:nNnTF$ , and then places the  $\langle code \rangle$  in the input stream if the  $\langle relation \rangle$  is true. After the  $\langle code \rangle$  has been processed by TeX the test will be repeated, and a loop will occur until the test is false.

\fp\_do\_until:nn 🌣

 $fp_do\_until:nn { \langle fpexpr_1 \rangle \langle relation \rangle \langle fpexpr_2 \rangle } {\langle code \rangle}$ 

New: 2012-08-16

Places the  $\langle code \rangle$  in the input stream for TEX to process, and then evaluates the relationship between the two  $\langle floating\ point\ expressions \rangle$  as described for \fp\_compare:nTF. If the test is false then the  $\langle code \rangle$  will be inserted into the input stream again and a loop will occur until the  $\langle relation \rangle$  is true.

\fp\_do\_while:nn 🌣

 $fp_do\_while:nn { \langle fpexpr_1 \rangle \langle relation \rangle \langle fpexpr_2 \rangle } {\langle code \rangle}$ 

New: 2012-08-16

Places the  $\langle code \rangle$  in the input stream for TEX to process, and then evaluates the relationship between the two  $\langle floating\ point\ expressions \rangle$  as described for \fp\_compare:nTF. If the test is true then the  $\langle code \rangle$  will be inserted into the input stream again and a loop will occur until the  $\langle relation \rangle$  is false.

\fp\_until\_do:nn 🌣

 $fp\_until\_do:nn { \langle fpexpr_1 \rangle \langle relation \rangle \langle fpexpr_2 \rangle } {\langle code \rangle}$ 

New: 2012-08-16

Evaluates the relationship between the two  $\langle floating\ point\ expressions \rangle$  as described for  $fp_compare:nTF$ , and then places the  $\langle code \rangle$  in the input stream if the  $\langle relation \rangle$  is false. After the  $\langle code \rangle$  has been processed by TEX the test will be repeated, and a loop will occur until the test is true.

\fp\_while\_do:nn 🌣

 $\footnote{fp\_while\_do:nn { \langle fpexpr_1 \rangle \langle relation \rangle \langle fpexpr_2 \rangle } {\langle code \rangle}}$ 

New: 2012-08-16

Evaluates the relationship between the two  $\langle floating\ point\ expressions \rangle$  as described for  $fp\_compare:nTF$ , and then places the  $\langle code \rangle$  in the input stream if the  $\langle relation \rangle$  is true. After the  $\langle code \rangle$  has been processed by TEX the test will be repeated, and a loop will occur until the test is false.

## 6 Some useful constants, and scratch variables

\c_	_zero_i	fp	
\c_	_minus_	_zero_	fp

Zero, with either sign.

New: 2012-05-08

\c\_one\_fp New: 2012-05-08 One as an fp: useful for comparisons in some places.

\c\_inf\_fp
\c\_minus\_inf\_fp

Infinity, with either sign. These can be input directly in a floating point expression as inf and -inf.

New: 2012-05-08

\c\_e\_fp Updated: 2012-05-08 The value of the base of the natural logarithm,  $e = \exp(1)$ .

\c\_pi\_fp

The value of  $\pi$ . This can be input directly in a floating point expression as pi.

Updated: 2013-11-17

\c\_one\_degree\_fp

New: 2012-05-08 Updated: 2013-11-17 The value of 1° in radians. Multiply an angle given in degrees by this value to obtain a result in radians. Note that trigonometric functions expecting an argument in radians or in degrees are both available. Within floating point expressions, this can be accessed as deg.

\l\_tmpa\_fp
\l\_tmpb\_fp

Scratch floating points for local assignment. These are never used by the kernel code, and so are safe for use with any IATEX3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.

\g\_tmpa\_fp \g\_tmpb\_fp Scratch floating points for global assignment. These are never used by the kernel code, and so are safe for use with any LATEX3-defined function. However, they may be overwritten by other non-kernel code and so should only be used for short-term storage.

# 7 Floating point exceptions

The functions defined in this section are experimental, and their functionality may be altered or removed altogether.

"Exceptions" may occur when performing some floating point operations, such as 0 / 0, or 10 \*\* 1e9999. The IEEE standard defines 5 types of exceptions.

- Overflow occurs whenever the result of an operation is too large to be represented as a normal floating point number. This results in  $\pm \infty$ .
- Underflow occurs whenever the result of an operation is too close to 0 to be represented as a normal floating point number. This results in  $\pm 0$ .
- Invalid operation occurs for operations with no defined outcome, for instance 0/0, or sin(∞), and almost any operation involving a NaN. This normally results in a NaN, except for conversion functions whose target type does not have a notion of NaN (e.g., \fp\_to\_dim:n).
- Division by zero occurs when dividing a non-zero number by 0, or when evaluating e.g.,  $\ln(0)$  or  $\cot(0)$ . This results in  $\pm\infty$ .
- *Inexact* occurs whenever the result of a computation is not exact, in other words, almost always. At the moment, this exception is entirely ignored in LATEX3.

To each exception is associated a "flag", which can be either on or off. By default, the "invalid operation" exception triggers an (expandable) error, and raises the corresponding flag. Other exceptions only raise the corresponding flag. The state of the flag can be tested and modified. The behaviour when an exception occurs can be modified (using \fp\_trap:nn) to either produce an error and turn the flag on, or only turn the flag on, or do nothing at all.

```
\fp_if_flag_on_p:n *
\fp_if_flag_on:n_TF *
```

```
\folion{0.85\linewidth}{$\folion_{if_flag_on:nTF {\langle exception \rangle} {\langle true\ code \rangle} {\langle false\ code \rangle}} \label{folion}
```

New: 2012-08-08

Tests if the flag for the  $\langle exception \rangle$  is on, which normally means the given  $\langle exception \rangle$  has occurred. This function is experimental, and may be altered or removed.

\fp\_flag\_off:n

\fp\_flag\_off:n {\( exception \) \}

New: 2012-08-08

Locally turns off the flag which indicates whether the  $\langle exception \rangle$  has occurred. This function is experimental, and may be altered or removed.

\fp\_flag\_on:n \*

\fp\_flag\_on:n {\( exception \) \}

New: 2012-08-08

Locally turns on the flag to indicate (or pretend) that the  $\langle exception \rangle$  has occurred. Note that this function is expandable: it is used internally by 13fp to signal when exceptions do occur. This function is experimental, and may be altered or removed.

\fp\_trap:nn

New: 2012-07-19 Updated: 2012-08-08 All occurrences of the  $\langle exception \rangle$  (invalid\_operation, division\_by\_zero, overflow, or underflow) within the current group are treated as  $\langle trap \ type \rangle$ , which can be

- none: the \(\langle exception\rangle\) will be entirely ignored, and leave no trace;
- flag: the \(\langle exception \rangle \) will turn the corresponding flag on when it occurs;
- error: additionally, the *(exception)* will halt the T<sub>E</sub>X run and display some information about the current operation in the terminal.

This function is experimental, and may be altered or removed.

# 8 Viewing floating points

\fp\_show:N

\fp\_show:c

\fp\_show:n

New: 2012-05-08 Updated: 2015-08-07  $\foligin{align*} \label{fpshow:N} $$ \begin{aligned} & fp\_show:N & \langle fp \ var \rangle \\ & fp\_show:N & \{\langle floating \ point \ expression \rangle \} \end{aligned}$ 

Evaluates the (floating point expression) and displays the result in the terminal.

# 9 Floating point expressions

### 9.1 Input of floating point numbers

We support four types of floating point numbers:

- $\pm 0.d_1d_2...d_{16} \cdot 10^n$ , a normal floating point number, with  $d_i \in [0,9]$ ,  $d_1 \neq 0$ , and  $|n| \leq 10000$ ;
- $\pm 0$ , zero, with a given sign;
- $\pm \infty$ , infinity, with a given sign;
- NaN, is "not a number", and can be either quiet or signalling (not yet: this distinction is currently unsupported);

(not yet) subnormal numbers  $\pm 0.d_1d_2...d_{16} \cdot 10^{-10000}$  with  $d_1 = 0$ .

Normal floating point numbers are stored in base 10, with 16 significant figures. On input, a normal floating point number consists of:

- $\langle sign \rangle$ : a possibly empty string of + and characters;
- \(\langle significand \rangle \): a non-empty string of digits together with zero or one dot;
- $\langle exponent \rangle$  optionally: the character **e**, followed by a possibly empty string of + and tokens, and a non-empty string of digits.

The sign of the resulting number is + if  $\langle sign \rangle$  contains an even number of -, and - otherwise, hence, an empty  $\langle sign \rangle$  denotes a non-negative input. The stored significand is obtained from  $\langle significand \rangle$  by omitting the decimal separator and leading zeros, and rounding to 16 significant digits, filling with trailing zeros if necessary. In particular, the value stored is exact if the input  $\langle significand \rangle$  has at most 16 digits. The stored  $\langle exponent \rangle$  is obtained by combining the input  $\langle exponent \rangle$  (0 if absent) with a shift depending on the position of the significand and the number of leading zeros.

A special case arises if the resulting  $\langle exponent \rangle$  is either too large or too small for the floating point number to be represented. This results either in an overflow (the number is then replaced by  $\pm \infty$ ), or an underflow (resulting in  $\pm 0$ ).

The result is thus  $\pm 0$  if and only if  $\langle significand \rangle$  contains no non-zero digit (*i.e.*, consists only in 0 characters, and an optional . character), or if there is an underflow. Note that a single dot is currently a valid floating point number, equal to +0, but that is not guaranteed to remain true.

Special numbers are input as follows:

- inf represents  $+\infty$ , and can be preceded by any  $\langle sign \rangle$ , yielding  $\pm \infty$  as appropriate.
- nan represents a (quiet) non-number. It can be preceded by any sign, but that will be ignored.
- Any unrecognizable string triggers an error, and produces a NaN.

Note that e-1 is not a representation of  $10^{-1}$ , because it could be mistaken with the difference of "e" and 1. This is consistent with several other programming languages. However, in order to avoid confusions, e-1 is not considered to be this difference either. To input the base of natural logarithms, use exp(1) or  $c_efp$ .

#### 9.2 Precedence of operators

We list here all the operations supported in floating point expressions, in order of decreasing precedence: operations listed earlier bind more tightly than operations listed below them.

- Function calls (sin, ln, etc).
- Binary \*\* and ^ (right associative).
- Unary +, -, !.
- Binary \*, /, and implicit multiplication by juxtaposition (2pi, 3(4+5), etc).
- Binary + and -.
- Comparisons >=, !=, <?, etc.
- Logical and, denoted by &&.
- Logical or, denoted by ||.
- Ternary operator ?: (right associative).

The precedence of operations can be overridden using parentheses. In particular, those precedences imply that

$$\begin{split} & \texttt{sin2pi} = \sin(2\pi) = 0, \\ & \texttt{2^2max}(3,4) = 2^{2\max(3,4)} = 256. \end{split}$$

Functions are called on the value of their argument, contrarily to TEX macros.

#### 9.3 Operations

We now present the various operations allowed in floating point expressions, from the lowest precedence to the highest. When used as a truth value, a floating point expression is false if it is  $\pm 0$ , and true otherwise, including when it is NaN.

 $: \fp_{eval:n} \{ \langle operand_1 \rangle : \langle operand_2 \rangle : \langle operand_3 \rangle \}$ 

The ternary operator ?: results in  $\langle operand_2 \rangle$  if  $\langle operand_1 \rangle$  is true, and  $\langle operand_3 \rangle$  if it is false (equal to  $\pm 0$ ). All three  $\langle operands \rangle$  are evaluated in all cases. The operator is right associative, hence

```
\fp_eval:n
{
    1 + 3 > 4 ? 1 :
    2 + 4 > 5 ? 2 :
    3 + 5 > 6 ? 3 : 4
}
```

first tests whether 1+3>4; since this isn't true, the branch following: is taken, and 2+4>5 is compared; since this is true, the branch before: is taken, and everything else is (evaluated then) ignored. That allows testing for various cases in a concise manner, with the drawback that all computations are made in all cases.

|| \fp\_eval:n {  $\langle operand_1 \rangle$   $\langle operand_2 \rangle$  }

If  $\langle operand_1 \rangle$  is true (non-zero), use that value, otherwise the value of  $\langle operand_2 \rangle$ . Both  $\langle operands \rangle$  are evaluated in all cases.

&&  $fp_eval:n \{ \langle operand_1 \rangle \&\& \langle operand_2 \rangle \}$ 

If  $\langle operand_1 \rangle$  is false (equal to  $\pm 0$ ), use that value, otherwise the value of  $\langle operand_2 \rangle$ . Both  $\langle operands \rangle$  are evaluated in all cases.

Each  $\langle relation \rangle$  consists of a non-empty string of  $\langle \cdot, \cdot, \cdot \rangle$ , and  $\langle \cdot, \cdot, \cdot \rangle$ , and  $\langle \cdot, \cdot, \cdot \rangle$  are true, and  $\langle \cdot, \cdot, \cdot \rangle$  are evaluated in all cases. See  $\langle \cdot, \cdot, \cdot \rangle$  are evaluated in all cases. See  $\langle \cdot, \cdot, \cdot \rangle$  for details.

```
+ \fp_eval:n { \langle operand_1 \rangle + \langle operand_2 \rangle }
- \fp_eval:n { \langle operand_1 \rangle - \langle operand_2 \rangle }
```

Computes the sum or the difference of its two  $\langle operands \rangle$ . The "invalid operation" exception occurs for  $\infty - \infty$ . "Underflow" and "overflow" occur when appropriate.

```
* \fp_eval:n { \langle operand_1 \rangle * \langle operand_2 \rangle } 
/ \fp_eval:n { \langle operand_1 \rangle / \langle operand_2 \rangle }
```

Computes the product or the ratio of its two  $\langle operands \rangle$ . The "invalid operation" exception occurs for  $\infty/\infty$ , 0/0, or  $0*\infty$ . "Division by zero" occurs when dividing a finite non-zero number by  $\pm 0$ . "Underflow" and "overflow" occur when appropriate.

```
+ \fp_eval:n { + \langle operand \rangle }
- \fp_eval:n { - \langle operand \rangle }
! \fp_eval:n { ! \langle operand \rangle }
```

The unary + does nothing, the unary - changes the sign of the  $\langle operand \rangle$ , and !  $\langle operand \rangle$  evaluates to 1 if  $\langle operand \rangle$  is false and 0 otherwise (this is the not boolean function). Those operations never raise exceptions.

```
** \fp_eval:n { \langle operand_1 \rangle ** \langle operand_2 \rangle } 
 \fp_eval:n { \langle operand_1 \rangle \cap \langle operand_2 \rangle }
```

Raises  $\langle operand_1 \rangle$  to the power  $\langle operand_2 \rangle$ . This operation is right associative, hence 2 \*\* 2 \*\* 3 equals  $2^{2^3} = 256$ . The "invalid operation" exception occurs if  $\langle operand_1 \rangle$  is negative or -0, and  $\langle operand_2 \rangle$  is not an integer, unless the result is zero (in that case, the sign is chosen arbitrarily to be +0). "Division by zero" occurs when raising  $\pm 0$  to a strictly negative power. "Underflow" and "overflow" occur when appropriate.

```
abs fp_eval:n { abs( \langle fpexpr \rangle ) }
```

Computes the absolute value of the  $\langle fpexpr \rangle$ . This function does not raise any exception beyond those raised when computing its operand  $\langle fpexpr \rangle$ . See also \fp\_abs:n.

```
exp \fp_eval:n { exp( \langle fpexpr \rangle ) }
```

Computes the exponential of the  $\langle fpexpr \rangle$ . "Underflow" and "overflow" occur when appropriate.

```
ln \fp_eval:n { ln( \langle fpexpr \rangle ) }
```

Computes the natural logarithm of the  $\langle fpexpr \rangle$ . Negative numbers have no (real) logarithm, hence the "invalid operation" is raised in that case, including for  $\ln(-0)$ . "Division by zero" occurs when evaluating  $\ln(+0) = -\infty$ . "Underflow" and "overflow" occur when appropriate.

```
max \fp_eval:n { max( \langle fpexpr_1 \rangle , \langle fpexpr_2 \rangle , ... ) } min \fp_eval:n { min( \langle fpexpr_1 \rangle , \langle fpexpr_2 \rangle , ... ) }
```

Evaluates each  $\langle fpexpr \rangle$  and computes the largest (smallest) of those. If any of the  $\langle fpexpr \rangle$  is a NaN, the result is NaN. Those operations do not raise exceptions.

```
round
trunc
ceil
floor
```

```
New: 2013-12-14
Updated: 2015-08-08
```

```
\label{eq:cond} $$ \begin{aligned} & \begin{array}{l} \begin{array}{l} \begin{array}{l} \begin{array}{l} \begin{array}{l} \\ \\ \end{array} \end{aligned} & \begin{array}{l} \\ \begin{array}{l} \\ \end{array} & \end{array} & \begin{array}{l} \\ \end{array} & \end{array} & \begin{array}{l} \\ \end{array} & \begin{array}{
```

Only round accepts a third argument. Evaluates  $\langle fpexpr_1 \rangle = x$  and  $\langle fpexpr_2 \rangle = n$  and  $\langle fpexpr_3 \rangle = t$  then rounds x to n places. If n is an integer, this rounds x to a multiple of  $10^{-n}$ ; if  $n = +\infty$ , this always yields x; if  $n = -\infty$ , this yields one of  $\pm 0$ ,  $\pm \infty$ , or NaN; if n is neither  $\pm \infty$  nor an integer, then an "invalid operation" exception is raised. When  $\langle fpexpr_2 \rangle$  is omitted, n = 0, i.e.,  $\langle fpexpr_1 \rangle$  is rounded to an integer. The rounding direction depends on the function.

- round yields the multiple of  $10^{-n}$  closest to x, with ties (x half-way between two such multiples) rounded as follows. If t is nan or not given the even multiple is chosen ("ties to even"), if  $t = \pm 0$  the multiple closest to 0 is chosen ("ties to zero"), if t is positive/negative the multiple closest to  $\infty/-\infty$  is chosen ("ties towards positive/negative infinity").
- floor, or the deprecated round-, yields the largest multiple of  $10^{-n}$  smaller or equal to x ("round towards negative infinity");
- ceil, or the deprecated round+, yields the smallest multiple of  $10^{-n}$  greater or equal to x ("round towards positive infinity");
- trunc, or the deprecated round0, yields a multiple of  $10^{-n}$  with the same sign as x and with the largest absolute value less that that of x ("round towards zero").

<sup>&</sup>quot;Overflow" occurs if x is finite and the result is infinite (this can only happen if  $\langle fpexpr_2 \rangle < -9984$ ).

Updated: 2013-11-17

Computes the sine, cosine, tangent, cotangent, cosecant, or secant of the  $\langle fpexpr \rangle$  given in radians. For arguments given in degrees, see sind, cosd, etc. Note that since  $\pi$  is irrational,  $\sin(8pi)$  is not quite zero, while its analog  $\sin d(8\times 180)$  is exactly zero. The trigonometric functions are undefined for an argument of  $\pm \infty$ , leading to the "invalid operation" exception. Additionally, evaluating tangent, cotangent, cosecant, or secant at one of their poles leads to a "division by zero" exception. "Underflow" and "overflow" occur when appropriate.

```
| Sind | \fp_eval:n { \sind( \langle fpexpr \rangle ) } \cosd | \fp_eval:n { \cosd( \langle fpexpr \rangle ) } \tand | \fp_eval:n { \tand( \langle fpexpr \rangle ) } \cotd | \fp_eval:n { \cotd( \langle fpexpr \rangle ) } \cscd | \fp_eval:n { \cscd( \langle fpexpr \rangle ) } \text{secd} | \fp_eval:n { \secd( \langle fpexpr \rangle ) } \end{arrangle}
```

New: 2013-11-02

Computes the sine, cosine, tangent, cotangent, cosecant, or secant of the  $\langle fpexpr \rangle$  given in degrees. For arguments given in radians, see  $\sin$ ,  $\cos$ , etc. Note that since  $\pi$  is irrational,  $\sin(8pi)$  is not quite zero, while its analog  $\sin d(8 \times 180)$  is exactly zero. The trigonometric functions are undefined for an argument of  $\pm \infty$ , leading to the "invalid operation" exception. Additionally, evaluating tangent, cotangent, cosecant, or secant at one of their poles leads to a "division by zero" exception. "Underflow" and "overflow" occur when appropriate.

```
asin \fp_eval:n { asin( \langle fpexpr \rangle ) } acos \fp_eval:n { acos( \langle fpexpr \rangle ) } acsc \fp_eval:n { acsc( \langle fpexpr \rangle ) } asec \fp_eval:n { asec( \langle fpexpr \rangle ) }
```

New: 2013-11-02

Computes the arcsine, arccosine, arccosecant, or arcsecant of the  $\langle fpexpr \rangle$  and returns the result in radians, in the range  $[-\pi/2,\pi/2]$  for asin and acsc and  $[0,\pi]$  for acos and asec. For a result in degrees, use asind, etc. If the argument of asin or acos lies outside the range [-1,1], or the argument of acsc or asec inside the range (-1,1), an "invalid operation" exception is raised. "Underflow" and "overflow" occur when appropriate.

```
asind \fp_eval:n { asind( \langle fpexpr \rangle ) } acosd \fp_eval:n { acosd( \langle fpexpr \rangle ) } acscd \fp_eval:n { acscd( \langle fpexpr \rangle ) } asecd \fp_eval:n { asecd( \langle fpexpr \rangle ) }
```

New: 2013-11-02

Computes the arcsine, arccosine, arccosecant, or arcsecant of the  $\langle fpexpr \rangle$  and returns the result in degrees, in the range [-90,90] for asin and acsc and [0,180] for acos and asec. For a result in radians, use asin, etc. If the argument of asin or acos lies outside the range [-1,1], or the argument of acsc or asec inside the range (-1,1), an "invalid operation" exception is raised. "Underflow" and "overflow" occur when appropriate.

```
atan \fp_eval:n { atan( \langle fpexpr \rangle ) } acot \fp_eval:n { atan( \langle fpexpr_1 \rangle , \langle fpexpr_2 \rangle ) } \fp_eval:n { acot( \langle fpexpr_1 \rangle ) } \fp_eval:n { acot( \langle fpexpr_1 \rangle , \langle fpexpr_2 \rangle ) }
```

Those functions yield an angle in radians: atand and acotd are their analogs in degrees. The one-argument versions compute the arctangent or arccotangent of the  $\langle fpexpr \rangle$ : arctangent takes values in the range  $[-\pi/2,\pi/2]$ , and arccotangent in the range  $[0,\pi]$ . The two-argument arctangent computes the angle in polar coordinates of the point with Cartesian coordinates  $(\langle fpexpr_2 \rangle, \langle fpexpr_1 \rangle)$ : this is the arctangent of  $\langle fpexpr_1 \rangle/\langle fpexpr_2 \rangle$ , possibly shifted by  $\pi$  depending on the signs of  $\langle fpexpr_1 \rangle$  and  $\langle fpexpr_2 \rangle$ . The two-argument arccotangent computes the angle in polar coordinates of the point  $(\langle fpexpr_1 \rangle, \langle fpexpr_2 \rangle)$ , equal to the arccotangent of  $\langle fpexpr_1 \rangle/\langle fpexpr_2 \rangle$ , possibly shifted by  $\pi$ . Both two-argument functions take values in the wider range  $[-\pi,\pi]$ . The ratio  $\langle fpexpr_1 \rangle/\langle fpexpr_2 \rangle$  need not be defined for the two-argument arctangent: when both expressions yield  $\pm 0$ , or when both yield  $\pm \infty$ , the resulting angle is one of  $\{\pm \pi/4, \pm 3\pi/4\}$  depending on signs. Only the "underflow" exception can occur.

Those functions yield an angle in degrees: at and acotd are their analogs in radians. The one-argument versions compute the arctangent or arccotangent of the  $\langle fpexpr \rangle$ : arctangent takes values in the range [-90,90], and arccotangent in the range [0,180]. The two-argument arctangent computes the angle in polar coordinates of the point with Cartesian coordinates  $(\langle fpexpr_2 \rangle, \langle fpexpr_1 \rangle)$ : this is the arctangent of  $\langle fpexpr_1 \rangle / \langle fpexpr_2 \rangle$ , possibly shifted by 180 depending on the signs of  $\langle fpexpr_1 \rangle$  and  $\langle fpexpr_2 \rangle$ . The two-argument arccotangent computes the angle in polar coordinates of the point  $(\langle fpexpr_1 \rangle, \langle fpexpr_2 \rangle)$ , equal to the arccotangent of  $\langle fpexpr_1 \rangle / \langle fpexpr_2 \rangle$ , possibly shifted by 180. Both two-argument functions take values in the wider range [-180, 180]. The ratio  $\langle fpexpr_1 \rangle / \langle fpexpr_2 \rangle$  need not be defined for the two-argument arctangent: when both expressions yield  $\pm 0$ , or when both yield  $\pm \infty$ , the resulting angle is one of  $\{\pm 45, \pm 135\}$  depending on signs. Only the "underflow" exception can occur.

sqrt

\fp\_eval:n { sqrt( \langle fpexpr \rangle ) }

New: 2013-12-14

Computes the square root of the  $\langle fpexpr \rangle$ . The "invalid operation" is raised when the  $\langle fpexpr \rangle$  is negative; no other exception can occur. Special values yield  $\sqrt{-0} = -0$ ,  $\sqrt{+0} = +0$ ,  $\sqrt{+\infty} = +\infty$  and  $\sqrt{\text{NaN}} = \text{NaN}$ .

inf The special values  $+\infty$ ,  $-\infty$ , and NaN are represented as inf, -inf and nan (see \c\_-nan\_fp, \c\_minus\_inf\_fp and \c\_nan\_fp).

Pi The value of  $\pi$  (see \c\_pi\_fp).

deg The value of 1° in radians (see \c\_one\_degree\_fp).

Those units of measurement are equal to their values in pt, namely

ex
in
pt
pc
cm
mm
dd
cc
nd
nc
bp

em

$$\begin{aligned} & \text{lin} = 72.27 \text{pt} \\ & \text{lpt} = 1 \text{pt} \\ & \text{lpc} = 12 \text{pt} \\ & \text{lcm} = \frac{1}{2.54} \text{in} = 28.45275590551181 \text{pt} \\ & \text{lmm} = \frac{1}{25.4} \text{in} = 2.845275590551181 \text{pt} \\ & \text{ldd} = 0.376065 \text{mm} = 1.07000856496063 \text{pt} \\ & \text{lcc} = 12 \text{dd} = 12.84010277952756 \text{pt} \\ & \text{lnd} = 0.375 \text{mm} = 1.066978346456693 \text{pt} \\ & \text{lnc} = 12 \text{nd} = 12.80374015748031 \text{pt} \\ & \text{lbp} = \frac{1}{72} \text{in} = 1.00375 \text{pt} \\ & \text{lsp} = 2^{-16} \text{pt} = 1.52587890625e - 5 \text{pt}. \end{aligned}$$

The values of the (font-dependent) units em and ex are gathered from TEX when the surrounding floating point expression is evaluated.

true false Other names for 1 and +0.

\fp\_abs:n

\fp\_abs:n {\langle floating point expression \rangle}

New: 2012-05-14 Updated: 2012-07-08 Evaluates the  $\langle floating\ point\ expression \rangle$  as described for  $fp_eval:n$  and leaves the absolute value of the result in the input stream. This function does not raise any exception beyond those raised when evaluating its argument. Within floating point expressions, abs() can be used.

```
\fp_max:nn *
\fp_min:nn *
```

New: 2012-09-26

```
$\begin{array}{ll} \begin{array}{ll} \begin{array}{ll} \left( \text{fp expression 1} \right) \end{array} \end{array} \ \left\{ \left( \text{fp expression 2} \right) \right\} \\ \end{array}
```

Evaluates the \( \)floating point expressions \( \) as described for \fp\_eval:n and leaves the resulting larger (max) or smaller (min) value in the input stream. This function does not raise any exception beyond those raised when evaluating its argument. Within floating point expressions, max() and min() can be used.

# 10 Disclaimer and roadmap

The package may break down if the escape character is among 0123456789\_+; if it receives a TFX primitive conditional affected by \exp\_not:N.

The following need to be done. I'll try to time-order the items.

- Decide what exponent range to consider.
- Support signalling nan.
- Modulo and remainder, and rounding functions quantize, quantize0, quantize+, quantize-, quantize=, round=. Should the modulo also be provided as (catcode 12) %?
- \fp\_format:nn  $\{\langle fpexpr \rangle\}$   $\{\langle format \rangle\}$ , but what should  $\langle format \rangle$  be? More general pretty printing?
- Add and, or, xor? Perhaps under the names all, any, and xor?
- Add log(x, b) for logarithm of x in base b.
- hypot (Euclidean length). Cartesian-to-polar transform.
- Hyperbolic functions cosh, sinh, tanh.
- Inverse hyperbolics.
- Base conversion, input such as OxAB.CDEF.
- Random numbers (pgfmath provides rnd, rand, random), with seed reset at every \fp\_set:Nn.
- Factorial (not with !), gamma function.
- Improve coefficients of the sin and tan series.
- Treat upper and lower case letters identically in identifiers, and ignore underscores.
- Add an array(1,2,3) and i=complex(0,1).
- Provide an experimental map function? Perhaps easier to implement if it is a single character, @sin(1,2)?
- Provide \fp\_if\_nan:nTF, and an isnan function?

• Support keyword arguments?

Pgfmath also provides box-measurements (depth, height, width), but boxes are not possible expandably.

Bugs. (Exclamation points mark important bugs.)

- Check that functions are monotonic when they should.
- Add exceptions to ?:, !<=>?, &&, ||, and !.
- Logarithms of numbers very close to 1 are inaccurate.
- When rounding towards  $-\infty$ , \dim\_to\_fp:n {0pt} should return -0, not +0.
- The result of  $(\pm 0) + (\pm 0)$ , of x + (-x), and of (-x) + x should depend on the rounding mode.
- 0e999999999 gives a  $T_EX$  "number too large" error.
- Subnormals are not implemented.
- The overflow trap receives the wrong argument in l3fp-expo (see exp(1e5678) in m3fp-traps001).

Possible optimizations/improvements.

- Document that |3trial/|3fp-types introduces tools for adding new types.
- In subsection 9.1, write a grammar.
- Fix the TWO BARS business with the index.
- It would be nice if the parse auxiliaries for each operation were set up in the corresponding module, rather than centralizing in l3fp-parse.
- Some functions should get an \_o ending to indicate that they expand after their result.
- More care should be given to distinguish expandable/restricted expandable (auxiliary and internal) functions.
- The code for the ternary set of functions is ugly.
- There are many ~ missing in the doc to avoid bad line-breaks.
- The algorithm for computing the logarithm of the significand could be made to use a 5 terms Taylor series instead of 10 terms by taking  $c = 2000/(\lfloor 200x \rfloor + 1) \in [10, 95]$  instead of  $c \in [1, 10]$ . Also, it would then be possible to simplify the computation of t. However, we would then have to hard-code the logarithms of 44 small integers instead of 9.
- Improve notations in the explanations of the division algorithm (I3fp-basics).

- Understand and document \\_\_fp\_basics\_pack\_weird\_low:NNNNw and \\_\_fp\_-basics\_pack\_weird\_high:NNNNNNNNw better. Move the other basics\_pack auxiliaries to l3fp-aux under a better name.
- Find out if underflow can really occur for trigonometric functions, and redoc as appropriate.
- Add bibliography. Some of Kahan's articles, some previous TEX fp packages, the international standards,...
- Also take into account the "inexact" exception?
- Support multi-character prefix operators (e.g., @/ or whatever)? Perhaps for including comments inside the computation itself??

#### Part XXIII

# The I3candidates package Experimental additions to I3kernel

### 1 Important notice

This module provides a space in which functions can be added to l3kernel (expl3) while still being experimental.

As such, the functions here may not remain in their current form, or indeed at all, in l3kernel in the future.

In contrast to the material in <code>I3experimental</code>, the functions here are all <code>small</code> additions to the kernel. We encourage programmers to test them out and report back on the <code>LaTeX-L</code> mailing list.

Thus, if you intend to use any of these functions from the candidate module in a public package offered to others for productive use (e.g., being placed on CTAN) please consider the following points carefully:

- Be prepared that your public packages might require updating when such functions are being finalized.
- Consider informing us that you use a particular function in your public package, e.g., by discussing this on the LaTeX-L mailing list. This way it becomes easier to coordinate any updates necessary without issues for the users of your package.
- Discussing and understanding use cases for a particular addition or concept also helps to ensure that we provide the right interfaces in the final version so please give us feedback if you consider a certain candidate function useful (or not).

We only add functions in this space if we consider them being serious candidates for a final inclusion into the kernel. However, real use sometimes leads to better ideas, so functions from this module are **not necessarily stable** and we may have to adjust them!

#### 2 Additions to **I3basics**

\cs\_log:N \cs\_log:c

New: 2014-08-22 Updated: 2015-08-03 Writes the definition of the  $\langle control\ sequence \rangle$  in the log file. See also \cs\_show:N which displays the result in the terminal.

\\_\_kernel\_register\_log:N \\_\_kernel\_register\_log:c

Updated: 2015-08-03

 $\verb|\__kernel_register_log:N| \langle register\rangle|$ 

Used to write the contents of a  $T_EX$  register to the log file in a form similar to  $\_-$ kernel\_register\_show:N.

#### 3 Additions to **I3box**

#### 3.1 Affine transformations

Affine transformations are changes which (informally) preserve straight lines. Simple translations are affine transformations, but are better handled in TEX by doing the translation first, then inserting an unmodified box. On the other hand, rotation and resizing of boxed material can best be handled by modifying boxes. These transformations are described here.

\box\_resize:Nnn
\box\_resize:cnn

```
\verb|\box_resize:Nnn| \langle box \rangle | \{\langle x\text{-}size \rangle\} | \{\langle y\text{-}size \rangle\}|
```

Resize the  $\langle box \rangle$  to  $\langle x\text{-}size \rangle$  horizontally and  $\langle y\text{-}size \rangle$  vertically (both of the sizes are dimension expressions). The  $\langle y\text{-}size \rangle$  is the vertical size (height plus depth) of the box. The updated  $\langle box \rangle$  will be an hbox, irrespective of the nature of the  $\langle box \rangle$  before the resizing is applied. Negative sizes will cause the material in the  $\langle box \rangle$  to be reversed in direction, but the reference point of the  $\langle box \rangle$  will be unchanged. Thus negative y-sizes will result in a box a depth dependent on the height of the original box a height dependent on the depth. The resizing applies within the current T<sub>E</sub>X group level.

```
\label{local_local_local_local_local} $$ \ \cos_resize_to_ht_plus_dp:Nn \ \cos_v=size_to_ht_plus_dp:cn $$ \cos_v=size_to_ht_plus_dp:cn $$
```

Resize the  $\langle box \rangle$  to  $\langle y\text{-}size \rangle$  vertically, scaling the horizontal size by the same amount  $(\langle y\text{-}size \rangle)$  is a dimension expression). The  $\langle y\text{-}size \rangle$  is the vertical size (height plus depth) of the box. The updated  $\langle box \rangle$  will be an hbox, irrespective of the nature of the  $\langle box \rangle$  before the resizing is applied. A negative size will cause the material in the  $\langle box \rangle$  to be reversed in direction, but the reference point of the  $\langle box \rangle$  will be unchanged. Thus negative  $y\text{-}\mathrm{sizes}$  will result in a box with depth dependent on the height of the original box and height dependent on the depth of the original. The resizing applies within the current TeX group level.

\box\_resize\_to\_ht:Nn \box\_resize\_to\_ht:cn

```
\verb|\box_resize_to_ht:Nn| \langle box \rangle | \{\langle y\text{-}size \rangle\}|
```

Resize the  $\langle box \rangle$  to  $\langle y\text{-}size \rangle$  vertically, scaling the horizontal size by the same amount  $(\langle y\text{-}size \rangle)$  is a dimension expression). The  $\langle y\text{-}size \rangle$  is the height only, not including depth, of the box. The updated  $\langle box \rangle$  will be an hbox, irrespective of the nature of the  $\langle box \rangle$  before the resizing is applied. A negative size will cause the material in the  $\langle box \rangle$  to be reversed in direction, but the reference point of the  $\langle box \rangle$  will be unchanged. Thus negative  $y\text{-}\mathrm{sizes}$  will result in a box with depth dependent on the height of the original box and height dependent on the depth of the original. The resizing applies within the current T<sub>E</sub>X group level.

\box\_resize\_to\_wd:Nn \box\_resize\_to\_wd:cn  $\verb|\box_resize_to_wd:Nn| \langle box \rangle | \{\langle x\text{-}size \rangle\}|$ 

Resize the  $\langle box \rangle$  to  $\langle x\text{-}size \rangle$  horizontally, scaling the vertical size by the same amount  $(\langle x\text{-}size \rangle)$  is a dimension expression). The updated  $\langle box \rangle$  will be an hbox, irrespective of the nature of the  $\langle box \rangle$  before the resizing is applied. A negative size will cause the material in the  $\langle box \rangle$  to be reversed in direction, but the reference point of the  $\langle box \rangle$  will be unchanged. Thus negative y-sizes will result in a box a depth dependent on the height of the original box a height dependent on the depth. The resizing applies within the current TeX group level.

\box\_resize\_to\_wd\_and\_ht:Nnn
\box\_resize\_to\_wd\_and\_ht:cnn

 $\verb|\box_resize_to_wd_and_ht:Nnn| \langle box \rangle | \{\langle x\text{-}size \rangle\} | \{\langle y\text{-}size \rangle\} | \{\langle y$ 

New: 2014-07-03

Resize the  $\langle box \rangle$  to a *height* of  $\langle x\text{-}size \rangle$  horizontally and  $\langle y\text{-}size \rangle$  vertically (both of the sizes are dimension expressions). The  $\langle y\text{-}size \rangle$  is the *height* of the box, ignoring any depth. The updated  $\langle box \rangle$  will be an hbox, irrespective of the nature of the  $\langle box \rangle$  before the resizing is applied. Negative sizes will cause the material in the  $\langle box \rangle$  to be reversed in direction, but the reference point of the  $\langle box \rangle$  will be unchanged.

\box\_rotate:Nn \box\_rotate:cn  $\box_rotate:Nn \box\ \{\angle\}\}$ 

Rotates the  $\langle box \rangle$  by  $\langle angle \rangle$  (in degrees) anti-clockwise about its reference point. The reference point of the updated box will be moved horizontally such that it is at the left side of the smallest rectangle enclosing the rotated material. The updated  $\langle box \rangle$  will be an hbox, irrespective of the nature of the  $\langle box \rangle$  before the rotation is applied. The rotation applies within the current T<sub>F</sub>X group level.

\box\_scale:Nnn
\box\_scale:cnn

 $\verb|\box_scale:Nnn| \langle box \rangle | \{\langle x-scale \rangle\} | \{\langle y-scale \rangle\}|$ 

Scales the  $\langle box \rangle$  by factors  $\langle x\text{-}scale \rangle$  and  $\langle y\text{-}scale \rangle$  in the horizontal and vertical directions, respectively (both scales are integer expressions). The updated  $\langle box \rangle$  will be an hbox, irrespective of the nature of the  $\langle box \rangle$  before the scaling is applied. Negative scalings will cause the material in the  $\langle box \rangle$  to be reversed in direction, but the reference point of the  $\langle box \rangle$  will be unchanged. Thus negative y-scales will result in a box a depth dependent on the height of the original box a height dependent on the depth. The resizing applies within the current TeX group level.

#### 3.2 Viewing part of a box

\box\_clip:N
\box\_clip:c

\box\_clip:N \langle box \rangle

Clips the  $\langle box \rangle$  in the output so that only material inside the bounding box is displayed in the output. The updated  $\langle box \rangle$  will be an hbox, irrespective of the nature of the  $\langle box \rangle$  before the clipping is applied. The clipping applies within the current T<sub>F</sub>X group level.

These functions require the  $\LaTeX$ 3 native drivers: they will not work with the  $\LaTeX$ 2 $\varepsilon$  graphics drivers!

**TEXhackers note:** Clipping is implemented by the driver, and as such the full content of the box is placed in the output file. Thus clipping does not remove any information from the raw output, and hidden material can therefore be viewed by direct examination of the file.

\box\_trim:Nnnnn \box\_trim:cnnnn  $\verb|\box_trim:Nnnn| \langle box \rangle \ \{\langle left \rangle\} \ \{\langle bottom \rangle\} \ \{\langle right \rangle\} \ \{\langle top \rangle\}$ 

Adjusts the bounding box of the  $\langle box \rangle$   $\langle left \rangle$  is removed from the left-hand edge of the bounding box,  $\langle right \rangle$  from the right-hand edge and so fourth. All adjustments are  $\langle dimension\ expressions \rangle$ . Material output of the bounding box will still be displayed in the output unless  $\langle box_clip:N$  is subsequently applied. The updated  $\langle box \rangle$  will be an hbox, irrespective of the nature of the  $\langle box \rangle$  before the trim operation is applied. The adjustment applies within the current TeX group level. The behavior of the operation where the trims requested is greater than the size of the box is undefined.

\box\_viewport:Nnnnn \box\_viewport:cnnnn  $\box\_viewport:Nnnn \ \langle box \rangle \ \{\langle 11x \rangle\} \ \{\langle 11y \rangle\} \ \{\langle urx \rangle\} \ \{\langle ury \rangle\}$ 

Adjusts the bounding box of the  $\langle box \rangle$  such that it has lower-left co-ordinates  $(\langle llx \rangle, \langle lly \rangle)$  and upper-right co-ordinates  $(\langle urx \rangle, \langle ury \rangle)$ . All four co-ordinate positions are  $\langle dimension\ expressions \rangle$ . Material output of the bounding box will still be displayed in the output unless  $\langle box_clip:N$  is subsequently applied. The updated  $\langle box \rangle$  will be an hbox, irrespective of the nature of the  $\langle box \rangle$  before the viewport operation is applied. The adjustment applies within the current TpX group level.

#### 4 Additions to I3clist

\clist\_log:N

\clist\_log:N \( comma list \)

\clist\_log:c

Writes the entries in the  $\langle comma \ list \rangle$  in the log file. See also  $\clist_show:N$  which displays the result in the terminal.

\clist\_log:n

\clist\_log:n {\langle tokens \rangle}

New: 2014-08-22

Writes the entries in the comma list in the log file. See also \clist\_show:n which displays the result in the terminal.

#### 5 Additions to **I3coffins**

\coffin\_resize:Nnn
\coffin\_resize:cnn

 $\verb|\coffin_resize:Nnn| & \langle coffin \rangle | \{ \langle width \rangle \} | \{ \langle total-height \rangle \}|$ 

Resized the  $\langle coffin \rangle$  to  $\langle width \rangle$  and  $\langle total\text{-}height \rangle$ , both of which should be given as dimension expressions.

\coffin\_rotate:Nn \coffin\_rotate:cn  $\coffin\_rotate:Nn \langle coffin \rangle \{\langle angle \rangle\}$ 

Rotates the  $\langle coffin \rangle$  by the given  $\langle angle \rangle$  (given in degrees counter-clockwise). This process will rotate both the coffin content and poles. Multiple rotations will not result in the bounding box of the coffin growing unnecessarily.

\coffin\_scale:Nnn
\coffin\_scale:cnn

 $\verb|\coffin_scale:Nnn| \langle coffin \rangle | \{\langle x-scale \rangle\} | \{\langle y-scale \rangle\}|$ 

Scales the  $\langle coffin \rangle$  by a factors  $\langle x\text{-}scale \rangle$  and  $\langle y\text{-}scale \rangle$  in the horizontal and vertical directions, respectively. The two scale factors should be given as real numbers.

\coffin\_log\_structure:N

\coffin\_log\_structure:N \( coffin \)

\coffin\_log\_structure:c

New: 2014-08-22

New: 2014-07-02

This function writes the structural information about the  $\langle coffin \rangle$  in the log file. The width, height and depth of the typeset material are given, along with the location of all of the poles of the coffin. See also  $\coffin_show_structure:N$  which displays the result in the terminal.

#### 6 Additions to **I3file**

\file\_if\_exist\_input:nTF

 $file_if_exist_input:n { \langle file name \rangle }$ 

 $file_if_exist_input:nTF {\langle file name \rangle} {\langle true code \rangle} {\langle false code \rangle}$ 

Searches for \( \file name \) using the current TeX search path and the additional paths controlled by \file\_path\_include:n). If found, inserts the \( \lambda true code \rangle \) then reads in the file as additional LATeX source as described for \file\_input:n. Note that \file\_if\_exist\_input:n does not raise an error if the file is not found, in contrast to \file\_input:n.

\ior\_map\_inline:Nn

\ior\_map\_inline:Nn \stream \ {\langle inline function \}}

New: 2012-02-11

Applies the  $\langle inline\ function \rangle$  to  $\langle lines \rangle$  obtained by reading one or more lines (until an equal number of left and right braces are found) from the  $\langle stream \rangle$ . The  $\langle inline\ function \rangle$  should consist of code which will receive the  $\langle line \rangle$  as #1. Note that TEX removes trailing space and tab characters (character codes 32 and 9) from every line upon input. TEX also ignores any trailing new-line marker from the file it reads.

\ior\_str\_map\_inline:Nn

 $\in str_map_inline:Nn {\langle stream \rangle} {\langle inline function \rangle}$ 

New: 2012-02-11

Applies the  $\langle inline\ function \rangle$  to every  $\langle line \rangle$  in the  $\langle stream \rangle$ . The material is read from the  $\langle stream \rangle$  as a series of tokens with category code 12 (other), with the exception of space characters which are given category code 10 (space). The  $\langle inline\ function \rangle$  should consist of code which will receive the  $\langle line \rangle$  as #1. Note that TEX removes trailing space and tab characters (character codes 32 and 9) from every line upon input. TEX also ignores any trailing new-line marker from the file it reads.

\ior\_map\_break:

\ior\_map\_break:

New: 2012-06-29

Used to terminate a  $\ior_map_...$  function before all lines from the  $\langle stream \rangle$  have been processed. This will normally take place within a conditional statement, for example

Use outside of a \ior\_map\_... scenario will lead to low level TEX errors.

TEXhackers note: When the mapping is broken, additional tokens may be inserted by the internal macro \\_\_prg\_break\_point:Nn before further items are taken from the input stream. This will depend on the design of the mapping function.

\ior\_map\_break:n

```
ior_map_break:n \{\langle tokens \rangle\}
```

New: 2012-06-29

Used to terminate a  $ior_map_...$  function before all lines in the  $\langle stream \rangle$  have been processed, inserting the  $\langle tokens \rangle$  after the mapping has ended. This will normally take place within a conditional statement, for example

Use outside of a \ior\_map\_... scenario will lead to low level TFX errors.

**TEXhackers note:** When the mapping is broken, additional tokens may be inserted by the internal macro  $\protect\operatorname{note}$  before the  $\langle tokens \rangle$  are inserted into the input stream. This will depend on the design of the mapping function.

\ior\_log\_streams:
\iow\_log\_streams:

\ior\_log\_streams:
\iow\_log\_streams:

New: 2014-08-22

Writes in the log file a list of the file names associated with each open stream: intended for tracking down problems.

# 7 Additions to **13fp**

\fp\_log:N
\fp\_log:c
\fp\_log:n

 $\label{log:N login} $$ \prod_{0 \le N \le n} (fp \ var) $$ \int_{0 \le n} {\langle floating \ point \ expression \rangle} $$$ 

New: 2014-08-22 Updated: 2015-08-07 Evaluates the  $\langle floating\ point\ expression \rangle$  and writes the result in the log file.

#### 8 Additions to 13int

\int\_log:N
\int\_log:c

\int\_log:N \langle integer \rangle

Writes the value of the  $\langle integer \rangle$  in the log file.

New: 2014-08-22 Updated: 2015-08-03 \int\_log:n

\int\_log:n {\(\( \)integer expression \( \)\}

New: 2014-08-22 Updated: 2015-08-07 Writes the result of evaluating the  $\langle integer\ expression \rangle$  in the log file.

### 9 Additions to I3keys

\keys\_log:nn

 $\ensuremath{\mbox{keys\_log:nn}} \{\langle module \rangle\} \{\langle key \rangle\}$ 

New: 2014-08-22

Writes in the log file the function which is used to actually implement a  $\langle key \rangle$  for a  $\langle module \rangle$ .

# 10 Additions to 13msg

In very rare cases it may be necessary to produce errors in an expansion-only context. The functions in this section should only be used if there is no alternative approach using \msg\_error:nnnnnn or other non-expandable commands from the previous section. Despite having a similar interface as non-expandable messages, expandable errors must be handled internally very differently from normal error messages, as none of the tools to print to the terminal or the log file are expandable. As a result, the message text and arguments are not expanded, and messages must be very short (with default settings, they are truncated after approximately 50 characters). It is advisable to ensure that the message is understandable even when truncated. Another particularity of expandable messages is that they cannot be redirected or turned off by the user.

Issues an "Undefined error" message from  $T_EX$  itself using the undefined control sequence  $\::error$  then prints "!  $\langle module \rangle$ : " $\langle error \ message \rangle$ , which should be short. With default settings, anything beyond approximately 60 characters long (or bytes in some engines) is cropped. A leading space might be removed as well.

# 11 Additions to l3prg

Minimal (lazy) evaluation can be obtained using the conditionals \bool\_lazy\_all:nTF, \bool\_lazy\_and:nnTF, \bool\_lazy\_any:nTF, or \bool\_lazy\_or:nnTF, which only eval-

uate their boolean expression arguments when they are needed to determine the resulting truth value. For example, when evaluating the boolean expression

the line marked with is skipped is not expanded because the result of \bool\_lazy\_-any\_p:n is known once the second boolean expression is found to be logically true. On the other hand, the last line is expanded because its logical value is needed to determine the result of \bool\_lazy\_and\_p:nn.

```
\bool_lazy_all_p:n *\bool_lazy_all:nTF *\
New: 2015-11-15
```

```
\bool_lazy_all_p:n \ \{ \langle boolexpr_1 \rangle \} \ \{ \langle boolexpr_2 \rangle \} \ \cdots \ \{ \langle boolexpr_N \rangle \} \ \} \ \\ \bool_lazy_all:nTF \ \{ \langle boolexpr_1 \rangle \} \ \{ \langle boolexpr_2 \rangle \} \ \cdots \ \{ \langle boolexpr_N \rangle \} \ \} \ \\ \{ \langle false \ code \rangle \} \ \\
```

Implements the "And" operation on the \langle boolean expressions \rangle, hence is true if all of them are true and false if any of them is false. Contrarily to the infix operator &&, only the \langle boolean expressions \rangle which are needed to determine the result of \bool\_lazy\_all:nTF will be evaluated. See also \bool\_lazy\_and:nnTF when there are only two \langle boolean expressions \rangle.

```
\bool_lazy_and_p:nn *\bool_lazy_and:nn<u>TF</u> *
```

```
\bool_lazy_and_p:nn \ \{\langle boolexpr_1\rangle\} \ \{\langle boolexpr_2\rangle\} \ \bool_lazy_and:nnTF \ \{\langle boolexpr_1\rangle\} \ \{\langle true \ code\rangle\} \ \{\langle false \ code\rangle\} \ \
```

New: 2015-11-15

Implements the "And" operation between two boolean expressions, hence is true if both are true. Contrarily to the infix operator &&, the  $\langle boolexpr_2 \rangle$  will only be evaluated if it is needed to determine the result of \bool\_lazy\_and:nnTF. See also \bool\_lazy\_all:nTF when there are more than two  $\langle boolean\ expressions \rangle$ .

```
\bool_lazy_any_p:n *
\bool_lazy_any:nTF *

New: 2015-11-15
```

```
\begin{tabular}{ll} $$ \bool_lazy_any_p:n { $$ {\o boolexpr_1$} } {\o bool_lazy_any:nTF { $$ {\o boolexpr_2$} } \cdots {\o boolexpr_N$} } {\o bool_lazy_any:nTF { $$ {\o boolexpr_2$} } \cdots {\o boolexpr_N$} } {\o false code$} $$
```

Implements the "Or" operation on the \( \begin{aligned} \lefta boolean expressions \rangle \), hence is true if any of them is true and false if all of them are false. Contrarily to the infix operator \( \begin{aligned} \lefta boolean expressions \rangle \) which are needed to determine the result of \\ \bool\_-\lefta zy\_any:nTF \text{ will be evaluated. See also \\bool\_lazy\_or:nnTF \text{ when there are only two } \( \begin{aligned} \lefta boolean expressions \rangle \).

```
\bool_lazy_or_p:nn ★
\bool_lazy_or:nnTF
```

```
\verb|\bool_lazy_or_p:nn| \{\langle boolexpr_1 \rangle\} | \{\langle boolexpr_2 \rangle\}|
\verb|\bool_lazy_or:nnTF {|\langle boolexpr_1 \rangle|} {|\langle boolexpr_2 \rangle|} {|\langle true \ code \rangle|} {|\langle false \ code \rangle|}
```

New: 2015-11-15

Implements the "Or" operation between two boolean expressions, hence is true if either one is true. Contrarily to the infix operator | | |, the  $\langle boolexpr_2 \rangle$  will only be evaluated if it is needed to determine the result of \bool\_lazy\_or:nnTF. See also \bool\_lazy\_any:nTF when there are more than two  $\langle boolean \ expressions \rangle$ .

\bool\_log:N \bool\_log:c

\bool\_log:N \langle boolean \rangle

Writes the logical truth of the  $\langle boolean \rangle$  in the log file.

New: 2014-08-22

Updated: 2015-08-03

\bool\_log:n {\langle boolean expression \rangle}

New: 2014-08-22 Updated: 2015-08-07

\bool\_log:n

Writes the logical truth of the  $\langle boolean \ expression \rangle$  in the log file.

#### **12** Additions to 13prop

```
\prop_map_tokens:Nn ☆
\prop_map_tokens:cn 🌣
```

```
\prop_map\_tokens: Nn \property list \property list \property \pr
```

Analogue of \prop\_map\_function: NN which maps several tokens instead of a single function. The  $\langle code \rangle$  receives each key-value pair in the  $\langle property | list \rangle$  as two trailing brace groups. For instance,

```
\prop_map_tokens:Nn \l_my_prop { \str_if_eq:nnT { mykey } }
```

will expand to the value corresponding to mykey: for each pair in \1\_my\_prop the function  $\mathsf{str}_{\mathsf{if}} = \mathsf{q:nnT}$  receives  $\mathsf{mykey}$ , the  $\langle key \rangle$  and the  $\langle value \rangle$  as its three arguments. For that specific task, \prop\_item: Nn is faster.

\prop\_log:N \prop\_log:c

\prop\_log:N \property list\

New: 2014-08-12

Writes the entries in the  $\langle property | list \rangle$  in the log file.

#### 13 Additions to 13seq

```
\seq_mapthread_function:NNN
                                                         \seq_mapthread_function: NNN \langle seq_1 \rangle \langle seq_2 \rangle \langle function \rangle
\seq_mapthread_function:(NcN|cNN|ccN) &
```

Applies  $\langle function \rangle$  to every pair of items  $\langle seq_1 - item \rangle - \langle seq_2 - item \rangle$  from the two sequences, returning items from both sequences from left to right. The  $\langle function \rangle$  will receive two n-type arguments for each iteration. The mapping will terminate when the end of either sequence is reached (i.e. whichever sequence has fewer items determines how many iterations occur).

\seq\_set\_filter:NNn \seq\_gset\_filter:NNn

Evaluates the  $\langle inline\ boolexpr \rangle$  for every  $\langle item \rangle$  stored within the  $\langle sequence_2 \rangle$ . The  $\langle inline\$  $boolexpr\rangle$  will receive the  $\langle item \rangle$  as #1. The sequence of all  $\langle items \rangle$  for which the  $\langle inline$ boolexpr\) evaluated to true is assigned to  $\langle sequence_1 \rangle$ .

TrXhackers note: Contrarily to other mapping functions, \seq\_map\_break: cannot be used in this function, and will lead to low-level TFX errors.

\seq\_set\_map:NNn \seq\_gset\_map:NNn  $\scalebox{ } \scalebox{ } \sc$ 

New: 2011-12-22

Applies  $\langle inline\ function \rangle$  to every  $\langle item \rangle$  stored within the  $\langle sequence_2 \rangle$ . The  $\langle inline\ function \rangle$ function should consist of code which will receive the  $\langle item \rangle$  as #1. The sequence resulting from x-expanding  $\langle inline\ function \rangle$  applied to each  $\langle item \rangle$  is assigned to  $\langle sequence_1 \rangle$ . As such, the code in  $\langle inline\ function \rangle$  should be expandable.

TeXhackers note: Contrarily to other mapping functions, \seq\_map\_break: cannot be used in this function, and will lead to low-level TFX errors.

\seq\_log:N \seq\_log:c

\seq\_log:N \sequence \

Writes the entries in the  $\langle sequence \rangle$  in the log file.

New: 2014-08-12

#### Additions to 13skip 14

\skip\_split\_finite\_else\_action:nnNN  $\langle dimen_1 \rangle \langle dimen_2 \rangle$ 

> Checks if the  $\langle skipexpr \rangle$  contains finite glue. If it does then it assigns  $\langle dimen_1 \rangle$  the stretch component and  $\langle dimen_2 \rangle$  the shrink component. If it contains infinite glue set  $\langle dimen_1 \rangle$ and  $\langle dimen_2 \rangle$  to 0 pt and place #2 into the input stream: this is usually an error or warning message of some sort.

\dim\_log:N

\dim\_log:N \dimension \

\dim\_log:c

Writes the value of the  $\langle dimension \rangle$  in the log file.

New: 2014-08-22

Updated: 2015-08-03

\dim\_log:n

\dim\_log:n {\dimension expression}}

New: 2014-08-22

Writes the result of evaluating the  $\langle dimension \ expression \rangle$  in the log file.

Updated: 2015-08-07

\skip\_log:N \skip\_log:c

 $\sin Skip_log:N \langle skip \rangle$ 

New: 2014-08-22

Writes the value of the  $\langle skip \rangle$  in the log file.

Updated: 2015-08-03

\skip\_log:n

\skip\_log:n {\langle skip expression \rangle}

New: 2014-08-22 Updated: 2015-08-07 Writes the result of evaluating the  $\langle skip \ expression \rangle$  in the log file.

\muskip\_log:N

\muskip\_log:N \( muskip \)

\muskip\_log:c

Writes the value of the  $\langle muskip \rangle$  in the log file.

New: 2014-08-22 Updated: 2015-08-03

\muskip\_log:n

\muskip\_log:n {\muskip expression\}

New: 2014-08-22 Updated: 2015-08-07 Writes the result of evaluating the  $\langle muskip \ expression \rangle$  in the log file.

#### 15 Additions to **3tl**

\tl\_if\_single\_token\_p:n \*
\tl\_if\_single\_token:nTF \*

```
\t1_{if\_single\_token\_p:n {\langle token \ list \rangle}} \t1_{if\_single\_token:nTF {\langle token \ list \rangle} {\langle true \ code \rangle} {\langle false \ code \rangle}
```

Tests if the token list consists of exactly one token, *i.e.* is either a single space character or a single "normal" token. Token groups  $\{\{...\}\}$  are not single tokens.

\tl\_reverse\_tokens:n \*

```
\t! \tl_reverse_tokens:n \{\langle tokens \rangle\}
```

This function, which works directly on  $T_EX$  tokens, reverses the order of the  $\langle tokens \rangle$ : the first will be the last and the last will become first. Spaces are preserved. The reversal also operates within brace groups, but the braces themselves are not exchanged, as this would lead to an unbalanced token list. For instance,  $t1_reverse_tokens:n \{a^{b})\}$  leaves {)(b}~a in the input stream. This function requires two steps of expansion.

**TEXhackers note:** The result is returned within the \unexpanded primitive (\exp\_not:n), which means that the token list will not expand further when appearing in an x-type argument expansion.

\tl\_count\_tokens:n \*

```
\t: \count\_tokens:n \{\langle tokens \rangle\}
```

Counts the number of  $T_EX$  tokens in the  $\langle tokens \rangle$  and leaves this information in the input stream. Every token, including spaces and braces, contributes one to the total; thus for instance, the token count of  $a^{\{bc\}}$  is 6. This function requires three expansions, giving an  $\langle integer\ denotation \rangle$ .

```
\tl_lower_case:n *
\tl_lower_case:n *
\tl_upper_case:n *
\tl_upper_case:n *
\tl_mixed_case:n *
\tl_mixed_case:n *
```

New: 2014-06-30 Updated: 2016-01-12

```
\label{local_constraints} $$ \tilde{\alpha}: {\langle tokens \rangle} $$ \tilde{\alpha}: {\langle language \rangle} {\langle tokens \rangle} $$
```

These functions are intended to be applied to input which may be regarded broadly as "text". They traverse the  $\langle tokens \rangle$  and change the case of characters as discussed below. The character code of the characters replaced may be arbitrary: the replacement characters will have standard document-level category codes (11 for letters, 12 for letter-like characters which can also be case-changed). Begin-group and end-group characters in the  $\langle tokens \rangle$  are normalized and become { and }, respectively.

Importantly, notice that these functions are intended for working with user text for typesetting. For case changing programmatic data see the l3str module and discussion there of \str\_lower\_case:n, \str\_upper\_case:n and \str\_fold\_case:n.

The functions perform expansion on the input in most cases. In particular, input in the form of token lists or expandable functions will be expanded *unless* it falls within one of the special handling classes described below. This expansion approach means that in general the result of case changing will match the "natural" outcome expected from a "functional" approach to case modification. For example

```
\tl_set:Nn \l_tmpa_tl { hello }
\tl_upper_case:n { \l_tmpa_tl \c_space_tl world }
will produce
```

HELLO WORLD

The expansion approach taken means that in package mode any LATEX  $2_{\varepsilon}$  "robust" commands which may appear in the input should be converted to engine-protected versions using for example the \robustify command from the etoolbox package.

\l\_tl\_case\_change\_math\_tl

Case changing will not take place within math mode material so for example

```
\tl_upper_case:n { Some~text~$y = mx + c$~with~{Braces} }
will become
SOME TEXT $y = mx + c$ WITH {BRACES}
```

Material inside math mode is left entirely unchanged: in particular, no expansion is undertaken.

Detection of math mode is controlled by the list of tokens in \l\_tl\_case\_change\_-math\_tl, which should be in open-close pairs. In package mode the standard settings is

```
$ $ \(\)
```

Note that while expansion occurs when searching the text it does not apply to math mode material (which should be unaffected by case changing). As such, whilst the opening token for math mode may be "hidden" inside a command/macro, the closing one cannot be as this is being searched for in math mode. Typically, in the types of "text" the case changing functions are intended to apply to this should not be an issue.

#### $\label{locality} $$1_tl_case\_change_exclude_tl$$

Case changing can be prevented by using any command on the list \l\_tl\_case\_change\_-exclude\_tl. Each entry should be a function to be followed by one argument: the latter will be preserved as-is with no expansion. Thus for example following

```
\tl_put_right:Nn \l_tl_case_change_exclude_tl { \NoChangeCase }
the input
  \tl_upper_case:n
      { Some~text~$y = mx + c$~with~\NoChangeCase {Protection} }
will result in
    SOME TEXT $y = mx + c$ WITH \NoChangeCase {Protection}
```

Notice that the case changing mapping preserves the inclusion of the escape functions: it is left to other code to provide suitable definitions (typically equivalent to \use:n). In particular, the result of case changing is returned protected by \exp\_not:n.

When used with  $\LaTeX 2_{\varepsilon}$  the commands \cite, \ensuremath, \label and \ref are automatically included in the list for exclusion from case changing.

#### $\label{local_local} $$1_tl_case\_change\_accents\_tl$$

This list specifies accent commands which should be left unexpanded in the output. This allows for example

```
\tl_upper_case:n { \" { a } }
to yield
\" { A }
```

irrespective of the expandability of ".

The standard contents of this variable is \", \', \\^, \\^, \\c, \\H, \\k, \\r, \\t, \\u and \\v.

"Mixed" case conversion may be regarded informally as converting the first character of the  $\langle tokens \rangle$  to upper case and the rest to lower case. However, the process is more complex than this as there are some situations where a single lower case character maps to a special form, for example ij in Dutch which becomes IJ. As such,  $\t1_{mixed\_-case:n(n)}$  implement a more sophisticated mapping which accounts for this and for modifying accents on the first letter. Spaces at the start of the  $\langle tokens \rangle$  are ignored when finding the first "letter" for conversion.

```
\tl_mixed_case:n { hello~WORLD }  % => "Hello world"
\tl_mixed_case:n { ~hello~WORLD }  % => " Hello world"
\tl_mixed_case:n { {hello}~WORLD }  % => "{Hello} world"
```

When finding the first "letter" for this process, any content in math mode or covered by \l\_tl\_case\_change\_exclude\_tl is ignored.

(Note that the Unicode Consortium describe this as "title case", but that in English title case applies on a word-by-word basis. The "mixed" case implemented here is a lower level concept needed for both "title" and "sentence" casing of text.)

#### \l\_tl\_mixed\_case\_ignore\_tl

The list of characters to ignore when searching for the first "letter" in mixed-casing is determined by \l\_tl\_mixed\_change\_ignore\_tl. This has the standard setting

where comparisons are made on a character basis.

As is generally true for expl3, these functions are designed to work with Unicode input only. As such, UTF-8 input is assumed for *all* engines. When used with X<sub>T</sub>T<sub>E</sub>X or LuaT<sub>E</sub>X a full range of Unicode transformations are enabled. Specifically, the standard mappings here follow those defined by the Unicode Consortium in UnicodeData.txt and SpecialCasing.txt. In the case of 8-bit engines, mappings are provided for characters which can be represented in output typeset using the T1 font encoding. Thus for example Ãď can be case-changed using pdfT<sub>E</sub>X. For pT<sub>E</sub>X only the ASCII range is covered as the engine treats input outside of this range as east Asian.

Context-sensitive mappings are enabled: language-dependent cases are discussed below. Context detection will expand input but treats any unexpandable control sequences as "failures" to match a context.

Language-sensitive conversions are enabled using the  $\langle language \rangle$  argument, and follow Unicode Consortium guidelines. Currently, the languages recognised for special handling are as follows.

- Azeri and Turkish (az and tr). The case pairs I/i-dotless and I-dot/i are activated
  for these languages. The combining dot mark is removed when lower casing I-dot
  and introduced when upper casing i-dotless.
- German (de-alt). An alternative mapping for German in which the lower case Eszett maps to a großes Eszett.
- Lithuanian (1t). The lower case letters i and j should retain a dot above when the accents grave, acute or tilde are present. This is implemented for lower casing of the relevant upper case letters both when input as single Unicode codepoints and when using combining accents. The combining dot is removed when upper casing in these cases. Note that *only* the accents used in Lithuanian are covered: the behaviour of other accents are not modified.
- Dutch (n1). Capitalisation of ij at the beginning of mixed cased input produces IJ
  rather than Ij. The output retains two separate letters, thus this transformation
  is available using pdfT<sub>E</sub>X.

Creating additional context-sensitive mappings requires knowledge of the underlying mapping implementation used here. The team are happy to add these to the kernel where they are well-documented (e.g. in Unicode Consortium or relevant government publications).

\tl\_set\_from\_file:Nnn
\tl\_set\_from\_file:cnn
\tl\_gset\_from\_file:Nnn
\tl\_gset\_from\_file:cnn

 $\verb|\tl_set_from_file:Nnn| \langle tl \rangle \ \{\langle setup \rangle\} \ \{\langle filename \rangle\}|$ 

Defines  $\langle tl \rangle$  to the contents of  $\langle filename \rangle$ . Category codes may need to be set appropriately via the  $\langle setup \rangle$  argument.

New: 2014-06-25

\tl\_set\_from\_file\_x:Nnn
\tl\_set\_from\_file\_x:cnn
\tl\_gset\_from\_file\_x:Nnn
\tl\_gset\_from\_file\_x:cnn

 $\verb|\tl_set_from_file_x:Nnn| \langle t1 \rangle | \{\langle setup \rangle\} | \{\langle filename \rangle\}|$ 

Defines  $\langle tl \rangle$  to the contents of  $\langle filename \rangle$ , expanding the contents of the file as it is read. Category codes and other definitions may need to be set appropriately via the  $\langle setup \rangle$  argument.

New: 2014-06-25

\tl\_log:N
\tl\_log:c

\tl\_log:N \langle tl var \rangle

New: 2014-08-22 Updated: 2015-08-01 Writes the content of the  $\langle tl \ var \rangle$  in the log file. See also \tl\_show:N which displays the result in the terminal.

\tl\_log:n

\tl\_log:n \token list\

New: 2014-08-22

Writes the  $\langle token \ list \rangle$  in the log file. See also  $\t1_show:n$  which displays the result in the terminal.

#### 16 Additions to l3tokens

\peek\_N\_type: TF

 $\verb|\peek_N_type:TF {| \langle true \ code \rangle}| \ \{\langle false \ code \rangle\}|$ 

Updated: 2012-12-20

Tests if the next  $\langle token \rangle$  in the input stream can be safely grabbed as an N-type argument. The test will be  $\langle false \rangle$  if the next  $\langle token \rangle$  is either an explicit or implicit begin-group or end-group token (with any character code), or an explicit or implicit space character (with character code 32 and category code 10), or an outer token (never used in LATEX3) and  $\langle true \rangle$  in all other cases. Note that a  $\langle true \rangle$  result ensures that the next  $\langle token \rangle$  is a valid N-type argument. However, if the next  $\langle token \rangle$  is for instance  $\langle c\_space\_token$ , the test will take the  $\langle false \rangle$  branch, even though the next  $\langle token \rangle$  is in fact a valid N-type argument. The  $\langle token \rangle$  will be left in the input stream after the  $\langle true\ code \rangle$  or  $\langle false\ code \rangle$  (as appropriate to the result of the test).

#### Part XXIV

# The I3sys package System/runtime functions

# The name of the job

\c\_sys\_jobname\_str

Constant that gets the "job name" assigned when TEX starts.

New: 2015-09-19

TEXhackers note: This copies the contents of the primitive \jobname. It is a constant that is set by TEX and should not be overwritten by the package.

#### 2 Date and time

\c\_sys\_minute\_int \c\_sys\_hour\_int \c\_sys\_day\_int \c\_sys\_month\_int \c\_sys\_year\_int

New: 2015-09-22

TeXhackers note: Whilst the underlying primitives can be altered by the user, this interface to the time and date is intended to be the "real" values.

The date and time at which the current job was started: these are all reported as integers.

#### 2.1Engine

\sys\_if\_engine\_luatex\_p: \* \sys\_if\_engine\_luatex:TF \sys\_if\_engine\_pdftex\_p: \sys\_if\_engine\_pdftex: TF \sys\_if\_engine\_ptex\_p: \sys\_if\_engine\_ptex: TF \sys\_if\_engine\_uptex\_p: \sys\_if\_engine\_uptex:TF \sys\_if\_engine\_xetex\_p: \sys\_if\_engine\_xetex: TF

 $\sys_if_engine_pdftex:TF \{\langle true\ code \rangle\} \{\langle false\ code \rangle\}$ 

Conditionals which allow engine-specific code to be used. The names follow naturally from those of the engine binaries: note that the (u)ptex tests are for  $\varepsilon$ -pTFX and  $\varepsilon$ -upTFX as expl3 requires the  $\varepsilon$ -TEX extensions. Each conditional is true for exactly one supported engine. In particular, \sys\_if\_engine\_ptex\_p: is true for  $\varepsilon$ -pTFX but false for  $\varepsilon$ -upTFX.

New: 2015-09-07

\c\_sys\_engine\_str

New: 2015-09-19

The current engine given as a lower case string: will be one of luatex, pdftex, ptex, uptex or xetex.

## 2.2 Output format

\sys\_if\_output\_dvi\_p: \*
\sys\_if\_output\_dvi: \bar{TF} \*
\sys\_if\_output\_pdf\_p: \*
\sys\_if\_output\_pdf: \bar{TF} \*

 $\sys_if_output_dvi: TF \ \{\langle true \ code \rangle\} \ \{\langle false \ code \rangle\}$ 

Conditionals which give the current output mode the T<sub>E</sub>X run is operating in. This will always be one of two outcomes, DVI mode or PDF mode. The two sets of conditionals are thus complementary and are both provided to allow the programmer to emphasise the most appropriate case.

New: 2015-09-19

New: 2015-09-19

\c\_sys\_output\_str

The current output mode given as a lower case string: will be one of dvi or pdf.

## Part XXV

# The I3luatex package LuaTeX-specific functions

### 1 Breaking out to Lua

The LuaTeX engine provides access to the Lua programming language, and with it access to the "internals" of TeX. In order to use this within the framework provided here, a family of functions is available. When used with pdfTeX or XeTeX these will raise an error: use \sys\_if\_engine\_luatex:T to avoid this. Details of coding the LuaTeX engine are detailed in the LuaTeX manual.

#### 1.1 T<sub>E</sub>X code interfaces

\lua\_now\_x:n > \lua\_now:n > \

New: 2015-06-29

 $\displaystyle \sum_{now:n} \{\langle token \ list \rangle\}$ 

The  $\langle token\ list \rangle$  is first tokenized by TEX, which will include converting line ends to spaces in the usual TEX manner and which respects currently-applicable TEX category codes. The resulting  $\langle Lua\ input \rangle$  is passed to the Lua interpreter for processing. Each \lua\_now:n block is treated by Lua as a separate chunk. The Lua interpreter will execute the  $\langle Lua\ input \rangle$  immediately, and in an expandable manner.

In the case of the  $\label{lua_now_x:n}$  version the input is fully expanded by  $T_EX$  in an x-type manner but the function remains fully expandable.

TEXhackers note: \lua\_now\_x:n is a macro wrapper around \directlua: when LuaTEX is in use two expansions will be required to yield the result of the Lua code.

\lua\_shipout\_x:n \lua\_shipout:n New: 2015-06-30

The  $\langle token\ list \rangle$  is first tokenized by TeX, which will include converting line ends to spaces in the usual TeX manner and which respects currently-applicable TeX category codes. The resulting  $\langle Lua\ input \rangle$  is passed to the Lua interpreter when the current page is finalised (i.e. at shipout). Each \lua\_shipout:n block is treated by Lua as a separate chunk. The Lua interpreter will execute the  $\langle Lua\ input \rangle$  during the page-building routine: no TeX expansion of the  $\langle Lua\ input \rangle$  will occur at this stage.

In the case of the \lua\_shipout\_x:n version the input is fully expanded by TEX in an x-type manner during the shipout operation.

**TEXhackers note:** At a TEX level, the  $\langle Lua \ input \rangle$  is stored as a "whatsit".

\lua\_escape\_x:n \*
\lua\_escape:n \*

 $\displaystyle \sum_{s \in \{token \ list\}}$ 

New: 2015-06-29

Converts the  $\langle token \ list \rangle$  such that it can safely be passed to Lua: embedded backslashes, double and single quotes, and newlines and carriage returns are escaped. This is done by prepending an extra token consisting of a backslash with category code 12, and for the line endings, converting them to n and r, respectively.

In the case of the  $\label{lua_escape_x:n}$  version the input is fully expanded by  $T_EX$  in an x-type manner but the function remains fully expandable.

TeXhackers note: \lua\_escape\_x:n is a macro wrapper around \luaescapestring: when LuaTeX is in use two expansions will be required to yield the result of the Lua code.

#### 1.2 Lua interfaces

As well as interfaces for TEX, there are a small number of Lua functions provided here. Currently these are intended for internal use only.

13kernel.strcmp

 $\13kernel.strcmp(\langle str\ one \rangle,\ \langle str\ two \rangle)$ 

Compares the two strings and returns 0 to TEX if the two are identical.

13kernel.charcat

\l3kernel.charcat(\langle charcode \rangle, \langle catcode \rangle)

Constructs a character of  $\langle charcode \rangle$  and  $\langle catcode \rangle$  and returns the result to T<sub>F</sub>X.

#### Part XXVI

# The **I3drivers** package Drivers

T<sub>E</sub>X relies on drivers in order to carry out a number of tasks, such as using color, including graphics and setting up hyper-links. The nature of the code required depends on the exact driver in use. Currently, I<sup>A</sup>T<sub>E</sub>X3 is aware of the following drivers:

- pdfmode: The "driver" for direct PDF output by both pdfTeX and LuaTeX (no separate driver is used in this case: the engine deals with PDF creation itself).
- dvips: The dvips program, which works in conjugation with pdfTEX or LuaTEX in DVI mode.
- dvipdfmx: The dvipdfmx program, which works in conjugation with pdfTeX or LuaTeX in DVI mode.
- dvisvgm: The dvisvgm program, which works in conjugation with pdfTEX or LuaTEX in DVI mode to create SVG output.
- xdvipdfmx: The driver used by X<sub>7</sub>T<sub>E</sub>X.

The code here is all very low-level, and should not in general be used outside of the kernel. It is also important to note that many of the functions here are closely tied to the immediate level "up", and they must be used in the correct contexts.d

# 1 Box clipping

\_\_driver\_box\_use\_clip:N

\\_\_driver\_box\_use\_clip:N \langle box \rangle

New: 2011-11-11

Inserts the content of the  $\langle box \rangle$  at the current insertion point such that any material outside of the bounding box will not be displayed by the driver. The material in the  $\langle box \rangle$  is still placed in the output stream: the clipping takes place at a driver level.

This function should only be used within a surrounding horizontal box construct.

# 2 Box rotation and scaling

Inserts the content of the  $\langle box \rangle$  at the current insertion point rotated by the  $\langle angle \rangle$  (expressed in degrees). The material is inserted with no apparent height or width, and is rotated such the T<sub>E</sub>X reference point of the box is the center of rotation and remains the reference point after rotation. It is the responsibly of the code using this function to adjust the apparent size of the box to be correct at the T<sub>E</sub>X side.

This function should only be used within a surrounding horizontal box construct.

```
\label{lem:new:2016-05-12} $$ \colon distribution of the content of the content
```

Inserts the content of the  $\langle box \rangle$  at the current insertion point scale by the  $\langle x\text{-}scale \rangle$  and  $\langle y\text{-}scale \rangle$ . The material is inserted with no apparent height or width. It is the responsibly of the code using this function to adjust the apparent size of the box to be correct at the TeX side.

This function should only be used within a surrounding horizontal box construct.

# 3 Color support

```
\__driver_color_ensure_current: \__driver_color_ensure_current:

New: 2011-09-03
Updated: 2012-05-18
```

Ensures that the color used to typeset material is that which was set when the material was placed in a box. This function is therefore required inside any "color safe" box to ensure that the box may be inserted in a location where the foreground color has been altered, while preserving the color used in the box.

# 4 Drawing

The drawing functions provided here are highly experimental. They are inspired heavily by the system layer of pgf (most have the same interface as the same functions in the latter's \pgfsys@... namespace). They are intended to form the basis for higher level drawing interfaces, which themselves are likely to be further abstracted for user access. Again, this model is heavily inspired by pgf and Tikz.

These low level drawing interfaces abstract from the driver raw requirements but still require an appreciation of the concepts of PostScript/PDF/SVG graphic creation.

At present not all drivers are covered by the following.

\\_\_driver\_draw\_begin:
\\_\_driver\_draw\_end:

\\_\_driver\_draw\_begin:

 $\langle content \rangle$ 

\\_\_driver\_draw\_end:

Defines a drawing environment. This will be a scope for the purposes of the graphics state. Depending on the driver, other set up may or may not take place here. The natural size of the  $\langle content \rangle$  should be zero from the TEX perspective: allowance for the size of the content must be made at a higher level (or indeed this can be skipped if the content is to overlap other material).

\\_\_driver\_draw\_scope\_begin:
\\_\_driver\_draw\_scope\_end:

\\_\_driver\_draw\_scope\_begin:

 $\langle { t content} 
angle$ 

\\_\_driver\_draw\_scope\_end:

Defines a scope for drawing settings and so on. Changes to the graphic state and concepts such as color or linewidth are localised to a scope. This function pair must never be used if an partial path is under construction: such paths must be entirely contained at one unbroken scope level.

#### 4.1 Path construction

\\_\_driver\_draw\_moveto:nn

 $\__driver_draw_move:nn \{\langle x \rangle\} \{\langle y \rangle\}$ 

Moves the current drawing reference point to  $(\langle x \rangle, \langle y \rangle)$ ; any active transformation matrix will apply.

\_\_driver\_draw\_lineto:nn

\\_\_driver\_draw\_lineto:nn  $\{\langle x \rangle\}$   $\{\langle y \rangle\}$ 

Adds a path from the current drawing reference point to  $(\langle x \rangle, \langle y \rangle)$ ; any active transformation matrix will apply. Note that nothing is drawn until a fill or stroke operation is applied, and that the path may be discarded or used as a clip without appearing itself.

\\_\_driver\_draw\_curveto:nnnnn

```
\__driver_draw_curveto:nnnnnn \{\langle x_1 \rangle\} \{\langle y_1 \rangle\} \{\langle x_2 \rangle\} \{\langle x_2 \rangle\} \{\langle x_3 \rangle\} \{\langle y_3 \rangle\}
```

Adds a Bezier curve path from the current drawing reference point to  $(\langle x_3 \rangle, \langle y_3 \rangle)$ , using  $(\langle x_1 \rangle, \langle y_1 \rangle)$  and  $(\langle x_2 \rangle, \langle y_2 \rangle)$  as control points; any active transformation matrix will apply. Note that nothing is drawn until a fill or stroke operation is applied, and that the path may be discarded or used as a clip without appearing itself.

\\_\_driver\_draw\_closepath:

\\_\_driver\_draw\_closepath:

Closes an existing path, adding a line from the current point to the start of path. Note that nothing is drawn until a fill or stroke operation is applied, and that the path may be discarded or used as a clip without appearing itself.

#### 4.2 Stroking and filling

Draws a line alone the current path, which will also be closed when \\_\_driver\_draw\_-closestroke: is used. The nature of the line drawn is influenced by settings for

- Line thickness
- Stroke color (or the current color if no specific stroke color is set)
- Line capping (how non-closed line ends should look)
- Join style (how a bend in the path should be rendered)
- Dash pattern

The path may also be used for clipping.

\\_\_driver\_draw\_fill:
\\_\_driver\_draw\_fillstroke:

⟨path construction⟩
\\_\_driver\_draw\_fill:

Fills the area surrounded by the current path: this will be closed prior to filling if it is not already. The fillstroke version will also stroke the path as described for \\_\_-driver\_draw\_stroke:. The fill is influenced by the setting for fill color (or the current color if no specific stroke color is set). The path may also be used for clipping. For paths which are self-intersecting or comprising multiple parts, the determination of which areas are inside the path is made using the nonzero winding rule number unless \\_\_driver\_-draw\_eor\_bool is true, in which case the even-odd rule is used.

\\_\_driver\_draw\_clip:

⟨path construction⟩
\\_\_driver\_draw\_clip:

Indicates that the current path should be used for clipping, such that any subsequent material outside of the path (but within the current scope) will not be shown. This command should be given once a path is complete but before it is stroked or filled (if appropriate).

\\_\_driver\_draw\_discardpath:

⟨path construction⟩
\\_\_driver\_draw\_discardpath:

Discards the current path without stroking or filling. This is primarily useful for paths constructed purely for clipping, as this alone does not end the paths existence.

#### 4.3 Stroke options

\\_\_driver\_draw\_linewidth:n

Sets the width to be used for stroking to  $\langle dimexpr \rangle$ .

\_\_driver\_draw\_dash:nn

 $\cline{condition} \cline{condition} \cline{con$ 

Sets the pattern of dashing to be used when stroking a line. The  $\langle dash\ pattern \rangle$  should be a comma-separated list of dimension expressions. This is then interpreted as a series of pairs of line-on and line-off lengths. For example 3pt, 4pt means that 3pt on, 4pt off, 3pt on, and so on. A more complex pattern will also repeat: 3pt, 4pt, 1pt, 2pt results in 3pt on, 4pt off, 1pt on, 2pt off, 3pt on, and so on. An odd number of entries means that the last is repeated, for example 3pt is equal to 3pt, 3pt. An empty pattern yields a solid line.

The  $\langle phase \rangle$  specifies an offset at the start of the cycle. For example, with a pattern 3pt a phase of 1pt will mean that the output is 2 pt on, 3 pt off, 3 pt on, 3 pt on, etc.

```
\__driver_draw_cap_butt: \__driver_draw_cap_butt:
\__driver_draw_cap_rectangle:
\__driver_draw_cap_round:
```

Sets the style of terminal stroke position to one of butt, rectangle or round.

```
\__driver_draw_join_bevel: \__driver_d
\__driver_draw_join_miter: \__driver_draw_join_round: Sets the style
```

\\_\_driver\_draw\_cap\_butt:

Sets the style of stroke joins to one of bevel, miter or round.

 $\cdots$  driver\_draw\_miterlimit:n \\_\_driver\_draw\_miterlimit:n  $\{\langle dimexpr \rangle\}$ 

Sets the miter limit of lines joined as a miter, as described in the PDF and PostScript manuals.

# Index

The italic numbers denote the pages where the corresponding entry is described, numbers underlined point to the definition, all others indicate the places where it is used.
